TOWARDS HOMOLOGICAL PROJECTIVE DUALITY FOR $\mathsf{S}^2\mathbb{P}^3$ AND $\mathsf{S}^2\mathbb{P}^4$

SHINOBU HOSONO AND HIROMICHI TAKAGI

Abstract. We provide homological foundations to establish conjectural homological projective dualities between 1) $\mathsf{S}^2\mathbb{P}^3$ and the double cover of the projective 9-space branched along the symmetric determinantal quartic, and 2) $\mathsf{S}^2\mathbb{P}^4$ and the double cover of the symmetric determinantal quintic in $\mathbb{P}^{14}$ branched along the symmetric determinantal locus of rank at most 3.

1. Introduction

Throughout this paper, we work over $\mathbb{C}$, the complex number field. We fix a vector space V of dimension $n+1$ and denote by V^* the dual vector space to V.

Let us consider the projective space $\mathbb{P}(\mathsf{S}^2V^*)$ which we identify with the space of quadrics in $\mathbb{P}(V)$. In a separate paper [14], we have considered the locus $\mathrm{S}_r \subset \mathbb{P}(\mathsf{S}^2V^*)$ which represents quadrics in $\mathbb{P}(V)$ of rank at most r. S_r is a determinantal variety which is defined by $(r+1)\times(r+1)$ minors of the generic $(n+1)\times(n+1)$ symmetric matrix, and we have called it *symmetric determinantal locus of rank at most* r. As studied in [ibid.], when r is even, S_r has a double cover T_r branched along S_{r-1}. T_r is called *double symmetric determinantal locus of rank at most* r. These definitions apply in the same way using the dual projective spaces, i.e., S_r^* and its double cover T_r^* (when r is even) are defined using the dual projective space $\mathbb{P}(\mathsf{S}^2V)$.

In [ibid.], we have studied algebro-geometric properties of S_r and T_r in detail motivated by the so-called *homological projective duality* (HPD) due to Kuznetsov [17]. HPD is a powerful framework to describe the derived category of a projective variety with its dual variety. Several interesting examples such as Pfaffian varieties (i.e., determinantal loci of anti-symmetric matrices) [18] and the second Veronese variety S_1^* [21] as well as the linear duality in general [17, §8] have been studied.

The purpose of this paper is to lay homological foundations to establish the HPDs for S_2^* with $n=3,4$. Indeed this paper is an extended version of the second part of [13] (the paper [14] contains generalizations of the first part of [ibid.]). It is useful to note that S_2^* may be identified with $\mathsf{S}^2\mathbb{P}(V)$ in a similar way to the relation of S_1^* and the second Veronese variety $v_2(\mathbb{P}(V))$. These conjectual HPDs are special cases of two different types of plausible HPDs, which have naturally arisen from our algebro-geometric study on S_r and T_r in [14, §3.5, 3.6].

The first one is the duality between S_{n+2-r}^* and T_r for each even r. We suspect that their suitable non-commutative resolutions are HPD to each other with respect to certain (dual) Lefschetz collections because there exist orthogonal linear sections of S_{n+2-r}^* and T_r such that they are Calabi-Yau varieties of the same dimension (see [14, Prop. 3.2 and 3.6]). In this paper, we consider the case where $n=r=4$, namely, we study S_2^* and T_4 for $n=4$. In this case, there exist orthogonal linear sections X of S_2^* and Y of T_4 such that they are *smooth* Calabi-Yau threefolds. X is so called a *Calabi-Yau threefold of Reye congruence*, and we call Y a *double quintic symmetroid*. In [14], we constructed certain resolutions $\widetilde{\mathrm{S}}_2^*$ and $\widetilde{\mathrm{T}}_4$ of S_2^* and T_4, respectively. In this paper, we construct (dual) Lefschetz collections in the derived categories of the resolutions $\widetilde{\mathrm{S}}_2^*$ and $\widetilde{\mathrm{T}}_4$ (Corollaries 3.5 and 5.13). We remark that the (dual) Lefschetz collections have been originally read off from a locally free resolution of certain ideal sheaf on $\widetilde{\mathrm{T}}_4 \times \widetilde{\mathrm{S}}_2^*$ (see [12]). Based on these (dual) Lefschetz collections, we have shown in [12] that X and Y are derived equivalent (see also [10, 11]). Moreover, we show that the dual Lefschetz collection in $\mathcal{D}^b(\widetilde{\mathrm{S}}_2^*)$ gives a dual Lefschetz decomposition of a categorical resolution of $\mathcal{D}^b(\mathrm{S}_2^*)$ $^{1)}$ defined by Kuznetsov (Theorem 3.7). These should be strong evidences for HPD between S_2^* and T_4.

The second plausible duality is between $\mathrm{S}^*_{n+1-\frac{r}{2}}$ and T_r for each even r. This duality may be observed in the resolution $\widetilde{\mathrm{S}}^*_{n+1-\frac{r}{2}}$ of $\mathrm{S}^*_{n+1-\frac{r}{2}}$ and the fiber space U_r of T_r which have been constructed by using certain projective bundles over the Grassmannian $\mathrm{G}(n+1-\frac{r}{2}, V)$ [14]. It turns out that $\widetilde{\mathrm{S}}^*_{n+1-\frac{r}{2}}$ and U_r are given as certain incident varieties in $\mathbb{P}(\mathsf{S}^2V)\times \mathrm{G}(n+1-\frac{r}{2}, V)$ and $\mathbb{P}(\mathsf{S}^2V^*)\times \mathrm{G}(n+1-\frac{r}{2}, V)$, respectively, and are orthogonal to each other with respect to the dual pairing between S^2V and S^2V^*. We will see that $\widetilde{\mathrm{S}}^*_{n+1-\frac{r}{2}}$ and U_r are precisely in the setting of the linear duality established by Kuzunetsov [17, §8] and hence HPD to each other. This duality between $\widetilde{\mathrm{S}}^*_{n+1-\frac{r}{2}}$ and U_r indicates certain relationship between the derived categories of $\mathrm{S}^*_{n+1-\frac{r}{2}}$ and T_r. In this paper, to provide a supporting evidence, we consider the case of $n=3$ and $r=4$, i.e., we study S_2^* and T_4 for $n=3$. In this case, we have an *Enriques surface of Reye congruence* and an *Artin-Mumford double solid* as an orthogonal linear sections of S_2^* and T_4, respectively. We construct (dual) Lefschetz collections in the derived categories of the resolutions $\widetilde{\mathrm{S}}_2^*$ and $\widetilde{\mathrm{T}}_4$ (Corollaries 3.3 and 5.11). Based on these (dual) Lefschetz collections, we will show in [15] that there exists a close relationship between the derived categories of the two linear sections. Moreover, we show that the dual Lefschetz collection in $\mathcal{D}^b(\widetilde{\mathrm{S}}_2^*)$ gives a dual Lefschetz decomposition of a categorical resolution of $\mathcal{D}^b(\mathrm{S}_2^*)$ $^{1)}$ defined by Kuznetsov (Theorem 3.7). These should be strong evidences for HPD between S_2^* and T_4.

They thank Nicolas Addington and Sergey Galkin for useful communications. They also thank Jorgen Vold Rennemo for letting us know about his Ph.D. thesis.

2. **Basic results**

2.1. **Borel-Weil-Bott Theorem.** We frequently use the following Borel-Weil-Bott Theorem.

---

1) Similar results have been obtained in [23] using the category of matrix factorizations and the variation of GIT method [1, 6, 8].

For a locally free sheaf $\mathcal{E}$ of rank r on a variety and a nonincreasing sequence $\beta = (\beta_1, \beta_2, \dots, \beta_r)$ of integers, we denote by $\Sigma^\beta \mathcal{E}$ the associated locally free sheaf with the Schur functor Σ^β.

Theorem 2.1. *Let* $\pi\colon \mathrm{G}(r, \mathcal{A}) \to X$ *be a Grassmann bundle for a locally free sheaf* $\mathcal{A}$ *on a variety* X *of rank* n *and* $0 \to \mathcal{S} \to \mathcal{A} \to \mathcal{Q} \to 0$ *the universal exact sequence. For* $\beta := (\alpha_1, \dots, \alpha_r) \in \mathbb{Z}^r$ $(\alpha_1 \geq \cdots \geq \alpha_r)$ *and* $\gamma := (\alpha_{r+1}, \dots, \alpha_n) \in \mathbb{Z}^{n-r}$ $(\alpha_{r+1} \geq \cdots \geq \alpha_n)$*, we set* $\alpha := (\beta, \gamma)$ *and* $\mathcal{V}(\alpha) := \Sigma^\beta \mathcal{S}^* \otimes \Sigma^\gamma \mathcal{Q}^*$*. Define* $\rho := (n, \dots, 1)$ *and for an element* σ *of the* n*-th symmetric group* $\mathfrak{S}_n$*, we set* $\sigma \cdot (\alpha) := \sigma(\alpha + \rho) - \rho$*. Then the followings hold:*

(1) *If* $\sigma(\alpha + \rho)$ *contains two equal integers, then* $R^i \pi_* \mathcal{V}(\alpha) = 0$ *for any* $i \geq 0$*.*
(2) *If there exists an element* $\sigma \in \mathfrak{S}_n$ *such that* $\sigma(\alpha + \rho)$ *is strictly decreasing, then* $R^i \pi_* \mathcal{V}(\alpha) = 0$ *for any* $i \geq 0$ *except* $R^{l(\sigma)} \pi_* \mathcal{V}(\alpha) = \Sigma^{\sigma \cdot (\alpha)} \mathcal{A}^*$*, where* $l(\sigma)$ *represents the length of* $\sigma \in \mathfrak{S}_n$*.*

Proof. See [4], [5], or [25, Cor. (4.19)]. □

2.2. **Basic definitions for triangulated categories.** We recall some basic definitions from the theory of triangulated categories (cf. [2, 3]).

Definition 2.2. An object $\mathcal{E}$ in a triangulated category $\mathcal{D}$ is called *an exceptional object* if $\mathrm{Hom}(\mathcal{E}, \mathcal{E}) \simeq \mathbb{C}$ and $\mathrm{Hom}^\bullet(\mathcal{E}, \mathcal{E}) = 0$ for $\bullet \neq 0$.

Definition 2.3. A triangulated subcategory $\mathcal{D}'$ of $\mathcal{D}$ is called *admissible* if there are right and left adjoint functors for the inclusion functor $i_* : \mathcal{D}' \to \mathcal{D}$.

Definition 2.4. A sequence $\mathcal{D}_1, \dots, \mathcal{D}_m$ of admissible triangulated subcategories in a triangulated category $\mathcal{D}$ is called a *semiorthogonal collection* if $\mathrm{Hom}_{\mathcal{D}}(\mathcal{D}_i, \mathcal{D}_j) = 0$ for any $i > j$. Moreover, if $\mathcal{D}_1, \dots, \mathcal{D}_m$ generates $\mathcal{D}$, then it is called a *semiorthogonal decomposition.*

A semiorthogonal collection of exceptional objects $\mathcal{E}_1, \dots, \mathcal{E}_n$ is called *an exceptional collection.* Moreover, if $\mathrm{Hom}^\bullet(\mathcal{E}_i, \mathcal{E}_j) = 0$ holds for any i, j and $\bullet \neq 0$, then it is called *a strongly exceptional collection.*

Hereafter, in this article, we restrict our attention to the cases of the derived categories of bounded complexes of coherent sheaves on a variety. In such cases, a special type of semiorthogonal collection plays an important role (cf. [17, 18]).

Definition 2.5. For a variety X, a *Lefschetz collection* of $\mathcal{D}^b(X)$ is a semiorthogonal collection of the following form:

$$\mathcal{D}_0, \mathcal{D}_1(1), \dots, \mathcal{D}_{m-1}(m-1),$$

where $0 \subset \mathcal{D}_{m-1} \subset \mathcal{D}_{m-2} \subset \cdots \subset \mathcal{D}_0 \subset \mathcal{D}^b(X)$ and (k) means the twist by $L^{\otimes k}$ with a fixed invertible sheaf L. Moreover, if $\mathcal{D}_0, \mathcal{D}_1(1), ..., \mathcal{D}_{m-1}(m-1)$ generate $\mathcal{D}^b(X)$, then it is called a *Lefschetz decomposition.*

Similarly, a *dual Lefschetz collection* of $\mathcal{D}^b(X)$ is a semiorthogonal collection of the following form:

$$\mathcal{D}_{m-1}(-(m-1)), \mathcal{D}_{m-2}(-(m-2)), \dots, \mathcal{D}_0,$$

where it holds that $0 \subset \mathcal{D}_{m-1} \subset \mathcal{D}_{m-2} \subset \cdots \subset \mathcal{D}_0 \subset \mathcal{D}^b(X)$. Moreover, if $\mathcal{D}_{m-1}(-(m-1)), \mathcal{D}_{m-2}(-(m-2)), \dots, \mathcal{D}_0$ generate $\mathcal{D}^b(X)$, then it is called a *dual Lefschetz decomposition.*

3. Dual Lefschetz collection in $\mathcal{D}^b(\check{\mathscr{X}})$

3.1. **Symmetric determinantal loci $\mathbf{S}_2^*$ and its Springer resolution $\widetilde{\mathbf{S}}_2^*$.** We recall that $\mathrm{S}_2^* \subset \mathbb{P}(\mathsf{S}^2 V)$ is the locus of quadrics in $\mathbb{P}(V^*)$ of rank at most two. The Springer resolution of S_2^* as in [14, (2.1)] is $\widetilde{\mathrm{S}}_2^* := \mathbb{P}(\mathsf{S}^2\mathcal{F})$, where $\mathcal{F}$ is the universal subbundle on $\mathrm{G}(2,V)$. As in [14, Subsect. 3.2], we may identify S_2^* with the Chow variety of length two 0-cycles in $\mathbb{P}(V)$. With this identification, we may interpret [14, Prop. 2.1 (2)] in this situation as follow:

$$\widetilde{\mathrm{S}}_2^* := \{([V_2],[\eta]) \mid \mathrm{Supp}\ \eta \subset \mathbb{P}(V_2)\} \subset \mathrm{G}(2,V) \times \mathrm{S}_2^*,$$

where we consider η is a length two 0-cycle in $\mathbb{P}(V)$. From this description of $\widetilde{\mathrm{S}}_2^*$, it is easy to see that $\widetilde{\mathrm{S}}_2^*$ is the Hilbert scheme of length two 0-dimensional subschemes of $\mathbb{P}(V)$ and the Springer resolution $\widetilde{\mathrm{S}}_2^* \to \mathrm{S}_2^*$ is the Hilbert-Chow morphism. Note that $\widetilde{\mathrm{S}}_2^* \to \mathrm{S}_2^*$ is isomorphic over $[\eta] \in \mathrm{S}_2^*$ if the support of η consists of two distinct points since then η determines the line $\mathbb{P}(V_2)$ such that $\eta \subset \mathbb{P}(V_2)$ uniquely. If the support of η consists of one point, say x, then the fiber over $[\eta]$ parameterizes lines through x. Therefore the exceptional locus E_f of $\widetilde{\mathrm{S}}_2^* \to \mathrm{S}_2^*$ is a prime divisor isomorphic to $\mathbb{P}(\mathcal{F})$. In particular, E_f has a $\mathbb{P}^{n-1}$-bundle structure over the rank one locus $\mathrm{S}_1^* \simeq \mathbb{P}(V)$.

3.2. **Homological properties of certain locally free sheaves on $\check{\mathscr{X}}$.** For brevity of notation, we set

$$\mathscr{X} := \mathrm{S}_2^*,\ \check{\mathscr{X}} := \widetilde{\mathrm{S}}_2^*,\ f\colon \check{\mathscr{X}} \to \mathscr{X},\ g\colon \check{\mathscr{X}} \to \mathrm{G}(2,V).$$

We also denote by $H_{\check{\mathscr{X}}}$ and $L_{\check{\mathscr{X}}}$ the pull-back of $\mathcal{O}_{\mathbb{P}(\mathsf{S}^2 V)}(1)$ and $\mathcal{O}_{\mathrm{G}(2,V)}(1)$. For brevity of notation, we often omit the subscripts $_{\check{\mathscr{X}}}$ from $H_{\check{\mathscr{X}}}$ and $L_{\check{\mathscr{X}}}$, and g^* for the pull-back of coherent sheaves to $\check{\mathscr{X}}$ of $\mathrm{G}(2,V)$.

We consider the Euler sequence

$$0 \to \mathcal{O}_{\check{\mathscr{X}}}(-H) \to \mathsf{S}^2\mathcal{F} \to T_{\check{\mathscr{X}}/G(2,V)}(-H) \to 0$$

associated to $\mathbb{P}(\mathsf{S}^2\mathcal{F}) \to \mathrm{G}(2,V)$. Twisting this by L we obtain

$$0 \to \mathcal{O}_{\check{\mathscr{X}}}(-H+L) \to \mathsf{S}^2\mathcal{F}(L) \to T_{\check{\mathscr{X}}/G(2,V)}(-H+L) \to 0. \tag{3.1}$$

Theorem 3.1. *Suppose $n = 3, 4$.*

1. *The ordered sequence $\mathcal{O}_{\check{\mathscr{X}}}(-H)$, $\mathcal{O}_{\check{\mathscr{X}}}(-L)$, $\mathcal{F}$, or $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H+L)$ is semi-orthogonal.*
2. *Let $\mathcal{A}$ or $\mathcal{B}$ be one of the locally free sheaves $\mathcal{O}_{\check{\mathscr{X}}}(-H)$, $\mathcal{O}_{\check{\mathscr{X}}}(-L)$, $\mathcal{F}$, or $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H+L)$ on $\check{\mathscr{X}}$. Then*

$$H^\bullet(\mathcal{A}^* \otimes \mathcal{B}(-t)) = 0 \ \textit{for} \ \begin{cases} t = 1 : n = 3, \\ t = 2, 3 : n = 3 \ \textit{and}\ \mathcal{B} \neq T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H+L), \\ 1 \leq t \leq 4 : n = 4. \end{cases}$$

We prepare the following lemma for our proof of the theorem in case $n = 4$. The lemma follows from [19, Prop.4.8], but for the reader's convenience we present a proof.

Lemma 3.2. *Suppose* $n = 4$. *For* $\mathcal{C} = \mathcal{A}^* \otimes \mathcal{B}$, *it holds that*

$$H^\bullet(\check{\mathscr{X}}, \mathcal{C}(-t)) \simeq H^{8-\bullet}(\check{\mathscr{X}}, \mathcal{C}^*(t-5)) \text{ for any } t.$$

Proof. By [14, §2.1], we have $K_{\check{\mathscr{X}}} = -5H + E_f$ where E_f is the f-exceptional divisor. By the Serre duality, we have $H^\bullet(\check{\mathscr{X}}, \mathcal{C}(-t)) \simeq H^{8-\bullet}(\check{\mathscr{X}}, \mathcal{C}^*((t-5)H+E_f))$ for any t. By the exact sequence

$$0 \to \mathcal{C}^*((t-5)) \to \mathcal{C}^*((t-5)H + E_f) \to \mathcal{C}^*((t-5)H + E_f)|_{E_f} \to 0,$$

we have only to show that $H^{8-\bullet}(E_f, \mathcal{C}^*((t-5)H + E_f)|_{E_f}) = 0$. As we see in Subsection 3.1, the image of E_f by f is S_1^* and $E_f \to \mathrm{S}_1^* \simeq \mathbb{P}^4$ is a $\mathbb{P}^3$-bundle. Therefore it suffices to show the vanishing of cohomology groups of the restriction of $\mathcal{C}^*((t-5)H + E_f)|_{E_f}$ to a fiber Γ of $E_f \to \mathrm{S}_2^*$. By [ibid.], $\mathcal{O}_{\check{\mathscr{X}}}(E_f)|_\Gamma \simeq \mathcal{O}_{\mathbb{P}^3}(-2)$ and $\mathcal{O}_{\check{\mathscr{X}}}(H)|_\Gamma \simeq \mathcal{O}_{\mathbb{P}^3}$. As we see in Subsection 3.1, E_f parameterizes pairs of a point $x \in \mathbb{P}(V)$ and a line l through x. Therefore a fiber $\Gamma \cong \mathbb{P}^3$ parameterizes lines through a fixed point (i.e., $V_1 \subset V_2 \subset V$ for a fixed point $x = [V_1]$). This implies that $g^*\mathcal{F}^*|_\Gamma \simeq \mathcal{O}_{\mathbb{P}^3} \oplus \mathcal{O}_{\mathbb{P}^3}(1)$. Restricting the natural injection $\mathcal{O}_{\check{\mathscr{X}}}(-H) \to g^*\mathsf{S}^2\mathcal{F}$ to Γ, we have an injection

$$\mathcal{O}_{\mathbb{P}^3} \to \mathcal{O}_{\mathbb{P}^3} \oplus \mathcal{O}_{\mathbb{P}^3}(-1) \oplus \mathcal{O}_{\mathbb{P}^3}(-2).$$

Therefore, by the Euler sequence, we have $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H+L)|_\Gamma \simeq \mathcal{O}_{\mathbb{P}^3} \oplus \mathcal{O}_{\mathbb{P}^3}(-1)$. Consequently, $\mathcal{C}^*((t-5)H+E_f)|_\Gamma$ is a direct sum of $\mathcal{O}_{\mathbb{P}^3}(-1)$, $\mathcal{O}_{\mathbb{P}^3}(-2)$ and $\mathcal{O}_{\mathbb{P}^3}(-3)$ for any $\mathcal{C}$ and t, hence all of its cohomology groups vanish. □

Proof of Theorem 3.1. In any case, we can calculate the cohomology groups in a similar way. Thus we only give computations only for $n = 4$ and $\mathcal{A} = \mathcal{F}$, $\mathcal{B} = T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H + L)$. Note that we may assume that $t = 0, 1, 2$ by Lemma 3.2, which simplifies the computations considerably. Twisted (3.1) with $\mathcal{F}^*(-tH)$, we obtain

$$\begin{aligned} (3.2) \qquad & 0 \to \mathcal{F}^*(-(t+1)H + L) \to \mathcal{F}^* \otimes \mathsf{S}^2\mathcal{F}(-tH + L) \to \\ & \qquad \mathcal{F}^* \otimes T_{\check{\mathscr{X}}/G(2,V)}(-(t+1)H + L) \to 0. \end{aligned}$$

We compute the cohomology groups of $\mathcal{F}^*(-(t+1)H + L)$ and $\mathcal{F}^* \otimes \mathsf{S}^2\mathcal{F}(-tH + L)$. We see that $H^\bullet(\mathcal{F}^*(-(t+1)H + L))$ is 0 for $t = 0, 1$ since $\check{\mathscr{X}} \to \mathrm{G}(2, V)$ is a $\mathbb{P}^2$-bundle. To compute $H^\bullet(\mathcal{F}^*(-3H+L))$, we take its Serre dual $H^{8-\bullet}(\check{\mathscr{X}}, \mathcal{F}(-3L)) \simeq H^{8-\bullet}(\mathrm{G}(2, V), \mathcal{F}^*(-4))$, which vanish by Theorem 2.1. We also see that $H^\bullet(\mathcal{F}^* \otimes \mathsf{S}^2\mathcal{F}(-tH + L))$ is 0 for $t = 1, 2$ since $\check{\mathscr{X}} \to \mathrm{G}(2, V)$ is a $\mathbb{P}^2$-bundle, and

$$H^\bullet(\mathcal{F}^* \otimes \mathsf{S}^2\mathcal{F}(L)) \simeq H^\bullet(\mathrm{G}(2, V), \mathcal{F}^* \otimes \{\mathsf{S}^2\mathcal{F}\}(1)) \simeq H^\bullet(\mathrm{G}(2, V), \Sigma^{2,-1}\mathcal{F}^* \oplus \mathcal{F}^*),$$

which vanish except for $\bullet = 0$, and

$$H^0(\mathrm{G}(2, V), \Sigma^{2,-1}\mathcal{F}^* \oplus \mathcal{F}^*) \simeq H^0(\mathrm{G}(2, V), \mathcal{F}^*) \simeq V^*$$

by Theorem 2.1. Therefore, by (3.2), we have $H^\bullet(\mathcal{F}^* \otimes T_{\check{\mathscr{X}}/G(2,V)}(-(t+1)H + L))$ is 0 except for $\bullet = 0$ and $t = 0$, and $H^0(\mathcal{F}^* \otimes T_{\check{\mathscr{X}}/G(2,V)}(-H + L)) \simeq V^*$.

□

3.3. **Dual Lefschetz collection in $\mathcal{D}^b(\check{\mathscr{X}})$.** It is straightforward to obtain the following result from Theorem 3.1.

Corollary 3.3. *Suppose $n=3$. Let $\Lambda := \{3, 2, 1_a, 1_b\}$ be an ordered set $(\Lambda, \prec)$. Define*

$$(\mathcal{F}_\alpha)_{\alpha\in\Lambda} := (\mathcal{F}_3, \mathcal{F}_2, \mathcal{F}_{1a}, \mathcal{F}_{1b}) = (\Omega^1_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-L+H),\ \mathcal{F}^*,\ \mathcal{O}_{\check{\mathscr{X}}}(L),\ \mathcal{O}_{\check{\mathscr{X}}}(H))$$

be an ordered collection of sheaves. We define the following triangulated subcategories of $\mathcal{D}^b(\check{\mathscr{X}})$:

$$\begin{aligned} \mathcal{D}^0_{\check{\mathscr{X}}} &= \mathcal{D}^1_{\check{\mathscr{X}}} := \langle \mathscr{F}^*_{1b}, \mathscr{F}^*_{1a}, \mathscr{F}^*_2, \mathscr{F}^*_3 \rangle, \\ \mathcal{D}^2_{\check{\mathscr{X}}} &= \mathcal{D}^3_{\check{\mathscr{X}}} := \langle \mathscr{F}^*_{1b}, \mathscr{F}^*_{1a}, \mathscr{F}^*_2 \rangle. \end{aligned}$$

Then

$$\mathcal{D}^3_{\check{\mathscr{X}}}(-3), \mathcal{D}^2_{\check{\mathscr{X}}}(-2), \mathcal{D}^1_{\check{\mathscr{X}}}(-1), \mathcal{D}^0_{\check{\mathscr{X}}}$$

is a dual Lefschetz collection, where $(-t)$ represents the twist by the sheaf $\mathcal{O}_{\check{\mathscr{X}}}(-tH)$.

Remark 3.4. We can obtain the following results by a similar method to show Theorem 3.1.

1. We see that $\mathrm{Ext}^4(\mathscr{F}^*_3, \mathscr{F}^*_3(-2)) \simeq \mathbb{C}$. This is the reason for the elimination of $\mathscr{F}^*_3$ from $\mathcal{D}^0_{\check{\mathscr{X}}}$.
2. $(\mathscr{F}_\alpha)_{\alpha\in\Lambda}$ is a strongly exceptional collection in $\mathcal{D}^b(\check{\mathscr{X}})$.
3. Hom's of the sheaves in the above collection are given by the following diagram:

$$\begin{tikzcd} & & \mathscr{F}_{1a} \\ \mathscr{F}_3 \arrow[r, "V^*"] \arrow[urr, bend left, "\mathsf{S}^2V^*"] \arrow[drr, bend right, "\mathsf{S}^2V^*"'] & \mathscr{F}_2 \arrow[ur, "V^*"'] \arrow[dr, "V^*"] & \\ & & \mathscr{F}_{1b} \end{tikzcd}$$

In case $n=4$, the following dual Lefschetz collection is suitable for our purpose (see [12]).

Corollary 3.5. *Suppose $n=4$. Let $\Lambda := \{3, 2, 1_a, 1_b\}$ be an ordered set $(\Lambda, \prec)$. Define an ordered collection of sheaves on $\check{\mathscr{X}}$;*

$$\begin{aligned} (\mathscr{F}_\alpha)_{\alpha\in\Lambda} &:= (\mathscr{F}_3, \mathscr{F}_2, \mathscr{F}_{1a}, \mathscr{F}_{1b}) \\ &= (\, \mathcal{O}_{\check{\mathscr{X}}},\ \mathcal{F}^*, T_{\check{\mathscr{X}}/G(2,V)}(-H+2L), \mathcal{O}_{\check{\mathscr{X}}}(L)\,). \end{aligned}$$

Set $\mathcal{D}_{\check{\mathscr{X}}} := \langle \mathscr{F}^*_{1b}, \mathscr{F}^*_{1a}, \mathscr{F}^*_2, \mathscr{F}^*_3 \rangle \subset \mathcal{D}^b(\check{\mathscr{X}})$. Then

$$\mathcal{D}_{\check{\mathscr{X}}}(-4), \dots, \mathcal{D}_{\check{\mathscr{X}}}(-1), \mathcal{D}_{\check{\mathscr{X}}}$$

is a dual Lefschetz collection, where $(-t)$ represents the twist by the sheaf $\mathcal{O}_{\check{\mathscr{X}}}(-tH)$.

Proof. By taking the dual of the sheaves of Theorem 3.1 (1), we have the following dual Lefschetz collection:

$$\begin{aligned}\Omega_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-3H-L),\ \mathscr{F}^*(-4H),\ \mathcal{O}_{\check{\mathscr{X}}}(-4H+L),\ \mathcal{O}_{\check{\mathscr{X}}}(-3H),&\\ \cdots\cdots&\\ \Omega_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(H-L),\ \mathscr{F}^*,\ \mathcal{O}_{\check{\mathscr{X}}}(L),\ \mathcal{O}_{\check{\mathscr{X}}}(H).&\end{aligned}$$

Let $\mathcal{C}$ be one of the sheaves in this collection except $\mathcal{O}_{\check{\mathscr{X}}}(H)$. Then by Lemma 3.2, it holds that

$$\mathrm{Hom}^{\bullet}(\mathcal{O}_{\check{\mathscr{X}}}(H),\mathcal{C})\simeq\mathrm{Hom}^{8-\bullet}(\mathcal{C},\mathcal{O}_{\check{\mathscr{X}}}(-4H)).$$

Therefore we obtain the following dual Lefschetz collection.

$$\begin{aligned}\mathcal{O}_{\check{\mathscr{X}}}(-4H),\ \Omega_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-3H-L),\ \mathscr{F}^*(-4H),\ \mathcal{O}_{\check{\mathscr{X}}}(-4H+L),&\\ \cdots\cdots&\\ \mathcal{O}_{\check{\mathscr{X}}},\ \Omega_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(H-L),\ \mathscr{F}^*,\ \mathcal{O}_{\check{\mathscr{X}}}(L).&\end{aligned}$$

Tensoring this with $\mathcal{O}_{\check{\mathscr{X}}}(-L)$, we obtain the desired dual Lefschetz collection. □

Remark 3.6. We may also obtain the following results by a similar method to show Theorem 3.1 (see [13]).

(1) $(\mathcal{F}_\alpha)_{\alpha\in\Lambda}$ is a strongly exceptional collection of $\mathcal{D}^b(\check{\mathscr{X}})$.

(2) Hom's of the sheaves in the above collection are given by the following diagram:

$$\begin{tikzcd}
 & & \overset{\mathcal{F}_{1_a}}{\circ} \\
\mathcal{F}_3\ \circ \arrow[r, "V^*"] \arrow[urr, bend left, "\mathsf{S}^2V^*"] \arrow[drr, bend right, "\wedge^2V^*"'] & \underset{\mathcal{F}_2}{\circ} \arrow[ur, "V^*"'] \arrow[dr, "V^*"] & \\
 & & \underset{\mathcal{F}_{1_b}}{\circ}
\end{tikzcd}\tag{3.3}$$

3.4. **Categorical and noncommutative resolution of $\mathcal{D}^b(\mathscr{X})$.** Since $\check{\mathscr{X}}\to\mathscr{X}$ is a resolution of rational singularities whose exceptional locus is a prime divisor E_f, we have a triangulated subcategory $\check{\mathcal{D}}\subset\mathcal{D}^b(\check{\mathscr{X}})$ called a categorical resolution of $\mathcal{D}^b(\mathscr{X})$ for every dual Lefschetz decomposition of $\mathcal{D}^b(E_f)$ [19, Theorem 1]. There is a natural dual Lefschetz decomposition of $\mathcal{D}(E_f)$ for the $\mathbb{P}^{n-1}$-bundle $E_f\to\mathrm{S}_1^*=v_2(\mathbb{P}(V))$ [24]:

(1) (n is even)

$$\mathcal{D}^b(E_f)=\langle\mathcal{C}_{\frac{n}{2}-1}(-n+2),\dots,\mathcal{C}_1(-2),\mathcal{C}_0\rangle,$$

where $\mathcal{C}_0=\mathcal{C}_1=\cdots=\mathcal{C}_{\frac{n}{2}-1}=\langle(f|_{E_f})^*\mathcal{D}^b(\mathbb{P}(V))(-1),(f|_{E_f})^*\mathcal{D}^b(\mathbb{P}(V))\rangle$, where $(-k)$ is the twist by $\mathcal{O}_{\check{\mathscr{X}}}(-kL)|_{E_f}$.

(2) (n is odd)

$$\mathcal{D}^b(E_f)=\langle\mathcal{C}_{\frac{n-1}{2}}(-n+1),\dots,\mathcal{C}_1(-2),\mathcal{C}_0\rangle,$$

where $\mathcal{C}_0=\mathcal{C}_1=\cdots=\mathcal{C}_{\frac{n-3}{2}}=\langle(f|_{E_f})^*\mathcal{D}^b(\mathbb{P}(V))(-1),(f|_{E_f})^*\mathcal{D}^b(\mathbb{P}(V))\rangle$, and $\mathcal{C}_{\frac{n-1}{2}}=\langle(f|_{E_f})^*\mathcal{D}^b(\mathbb{P}(V))\rangle$.

Let $\check{\mathcal{D}}$ be the triangulated subcategory of $\mathcal{D}^b(\check{\mathscr{X}})$ which consists of objects F such that $\iota^* F \in \mathcal{C}_0$, where ι is the natural closed embedding $E_f \to \check{\mathscr{X}}$. By [19], $\mathcal{D}^b(\check{\mathscr{X}})$ has the following semi-orthogonal decomposition:

$$\mathcal{D}^b(\check{\mathscr{X}}) = \begin{cases} \langle \iota_*\mathcal{C}_{\frac{n}{2}-1}(-n+2), \dots, \iota_*\mathcal{C}_1(-2), \check{\mathcal{D}}\rangle : n \text{ is even.} \\ \langle \iota_*\mathcal{C}_{\frac{n-1}{2}}(-n+1), \dots, \iota_*\mathcal{C}_1(-2), \check{\mathcal{D}}\rangle : n \text{ is odd.} \end{cases}$$

Recall that $\mathscr{X}$ is Gorenstein if and only if n is even [14, §2.1]. When n is even, $\check{\mathcal{D}}$ is strongly crepant. Indeed, in this case, the conditions of [ibid., Prop. 4.7] holds:

- $\mathcal{C}_0 = \mathcal{C}_1 = \dots = \mathcal{C}_{\frac{n}{2}-1}$(the decomposition is called *rectangular*), and
- the discrepancy of f is $\frac{n-2}{2}$ ([14, §2.1]), which is equal to the length of the decomposition of $\mathcal{D}^b(E_f)$.

The categorical resolution is also related to the noncommutative resolution by Van den Bergh ([19, Theorem 2]). It is easy to see that

$$\mathcal{R} := f_*\mathcal{E}nd(\mathcal{O}_{\check{\mathscr{X}}} \oplus \mathcal{O}_{\check{\mathscr{X}}}(-L))$$

satisfies the assumptions of [ibid.]; to check $\mathcal{C}_0$ is generated by $\iota^*\mathcal{E}$ is obvious, and to check $\mathcal{E}$ is tilting follows from the standard relative vanishing theorem. Thus

$$\check{\mathcal{D}} \simeq \mathcal{D}(\mathscr{X}, \mathcal{R}).$$

3.5. Dual Lefschetz decomposition of the categorical resolution for $n = 2, 3, 4$.

Theorem 3.7. *For $n = 2, 3, 4$, we have the following dual Lefschetz decomposition of $\check{\mathcal{D}}$:*

$$\check{\mathcal{D}} \simeq \langle \mathcal{A}_n(-n), \dots, \mathcal{A}_1(-1), \mathcal{A}_0\rangle,$$

where

$$\begin{aligned} \mathcal{A}_0 &= \mathcal{A}_1 = \mathcal{A}_2 = \langle \mathcal{O}_{\check{\mathscr{X}}}(-H), \mathcal{O}_{\check{\mathscr{X}}}(-L), \mathfrak{F}\rangle \textit{ for } n = 2, \\ \mathcal{A}_0 &= \mathcal{A}_1 = \langle \mathcal{O}_{\check{\mathscr{X}}}(-H),\ \mathcal{O}_{\check{\mathscr{X}}}(-L),\ \mathfrak{F},\ T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H+L)\rangle, \textit{ and} \\ \mathcal{A}_2 &= \mathcal{A}_3 = \langle \mathcal{O}_{\check{\mathscr{X}}}(-H),\ \mathcal{O}_{\check{\mathscr{X}}}(-L),\ \mathfrak{F}\rangle \textit{ for } n = 3, \\ \mathcal{A}_0 &= \dots = \mathcal{A}_4 = \langle \mathcal{O}_{\check{\mathscr{X}}}(-H),\ \mathcal{O}_{\check{\mathscr{X}}}(-L),\ \mathfrak{F},\ T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H+L)\rangle \textit{ for } n = 4. \end{aligned}$$

We set

$$\check{\mathscr{X}}_n := \mathbb{P}(\mathsf{S}^2\mathfrak{F}),\ \mathscr{X}_n := \mathsf{S}^2\mathbb{P}(V) \text{ for } V \text{ with } \dim V = n+1.$$

Proof of Theorem 3.7 in case $n = 2$.

Note that $\check{\mathcal{D}}$ is equivalent to $\mathcal{D}^b(\check{\mathscr{X}}_2)$ since $\check{\mathscr{X}}_2 \to \mathscr{X}_2$ is crepant. Since $\check{\mathscr{X}}_2$ is a $\mathbb{P}^2$-bundle over the projective plane $\mathrm{G}(2,V) \simeq \mathbb{P}(V^*)$, the derived category $\mathcal{D}^b(\check{\mathscr{X}}_2)$ has the following standard semi-orthogonal decomposition by Beilinson's and Orlov's results:

$$\begin{aligned} \mathcal{D}^b(\check{\mathscr{X}}_2) = \langle\quad & \mathcal{O}_{\check{\mathscr{X}}_3}(-2H-L),\quad \mathfrak{F}(-2H),\quad \mathcal{O}_{\check{\mathscr{X}}_3}(-2H) \\ & \mathcal{O}_{\check{\mathscr{X}}_3}(-H-L),\quad \mathfrak{F}(-H),\quad \mathcal{O}_{\check{\mathscr{X}}_3}(-H), \\ & \mathcal{O}_{\check{\mathscr{X}}_3}(-L),\quad \mathfrak{F},\quad \mathcal{O}_{\check{\mathscr{X}}_3} \quad \rangle. \end{aligned}$$

Since $K_{\check{\mathscr{X}}_2} = -3H$, we obtain by mutating $\mathcal{O}_{\check{\mathscr{X}}_2}$ to the left;

$$\begin{aligned} \mathcal{D}^b(\check{\mathscr{X}}_2) = \langle\quad & \mathcal{O}_{\check{\mathscr{X}}_3}(-3H),\quad \mathcal{O}_{\check{\mathscr{X}}_3}(-2H-L),\quad \mathfrak{F}(-2H), \\ & \mathcal{O}_{\check{\mathscr{X}}_3}(-2H),\quad \mathcal{O}_{\check{\mathscr{X}}_3}(-H-L),\quad \mathfrak{F}(-H), \\ & \mathcal{O}_{\check{\mathscr{X}}_3}(-H),\quad \mathcal{O}_{\check{\mathscr{X}}_3}(-L),\quad \mathfrak{F} \quad \rangle, \end{aligned} \tag{3.4}$$

which is nothing but the desired result for $n = 2$. □

The rest of this subsection is occupied with our proof of Theorem 3.7 in case $n = 3, 4$.

We have already shown that $\mathcal{A}_n(-n), \ldots, \mathcal{A}_1(-1), \mathcal{A}_0$ is semi-orthogonal in Theorem 3.1. Besides, they are contained in the left orthogonal to

$$\iota_*\mathcal{C}_1(-2) := \begin{cases} \iota_*(f|_{E_f})^*\mathcal{D}^b(\mathbb{P}^3)(-2) : n = 3, \\ \langle (f|_{E_f})^*\mathcal{D}^b(\mathbb{P}^4)(-3), (f|_{E_f})^*\mathcal{D}^b(\mathbb{P}^4)(-2)\rangle : n = 4 \end{cases}$$

since the restrictions of

$$\mathcal{O}_{\check{\mathscr{X}}_n}(-H),\ \mathcal{O}_{\check{\mathscr{X}}_n}(-L),\ \mathcal{F},\ T_{\check{\mathscr{X}}_n/\mathrm{G}(2,V)}(-H+L)$$

to a fiber $\simeq \mathbb{P}^{n-1}$ of $E_f \to \mathbb{P}(V)$ are direct sums of $\mathcal{O}_{\mathbb{P}^{n-1}}$ and $\mathcal{O}_{\mathbb{P}^{n-1}}(-1)$ (cf. the proof of Lemma 3.2).

We set

$$\begin{cases} \mathcal{A} := \mathcal{A}_0 = \mathcal{A}_1,\ \mathcal{A}' := \mathcal{A}_2 = \mathcal{A}_3 : n = 3, \\ \mathcal{A} := \mathcal{A}_0 = \cdots = \mathcal{A}_4 : n = 4. \end{cases}$$

We define the following triangulated subcategory $\mathcal{C} \subset \mathcal{D}^b(\check{\mathscr{X}}_n)$:

$$\mathcal{C} := \begin{cases} {}^\perp\langle \iota_*\mathcal{C}_1(-2), \mathcal{A}'(-3), \mathcal{A}'(-2), \mathcal{A}(-1), \mathcal{A}\rangle : n = 3, \\ {}^\perp\langle \iota_*\mathcal{C}_1(-2), \mathcal{A}(-4), \mathcal{A}(-3), \mathcal{A}(-2), \mathcal{A}(-1), \mathcal{A}\rangle : n = 4. \end{cases}$$

Then, by [2], we have the following semiorthogonal decomposition of $\mathcal{D}^b(\check{\mathscr{X}}_n)$:

(3.5)

$$\begin{array}{llllll}
\mathcal{D}^b(\check{\mathscr{X}}_3) = \langle \iota_*\mathcal{C}_1(-2), & \mathcal{O}_{\check{\mathscr{X}}_3}(-4H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-3H-L), & \mathcal{F}(-3H), & & \\
& \mathcal{O}_{\check{\mathscr{X}}_3}(-3H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-2H-L), & \mathcal{F}(-2H), & & \\
& \mathcal{O}_{\check{\mathscr{X}}_3}(-2H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-H-L), & \mathcal{F}(-H), & T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-2H+L) & \\
& \mathcal{O}_{\check{\mathscr{X}}_3}(-H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-L), & \mathcal{F}, & T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-H+L), & \mathcal{C}\rangle.
\end{array}$$

Note that the restriction of the gray part of (3.5) corresponds to the r.h.s. of (3.4).

(3.6)

$$\begin{array}{llllll}
\mathcal{D}^b(\check{\mathscr{X}}_4) = \langle \iota_*\mathcal{C}_1(-2), & \mathcal{O}_{\check{\mathscr{X}}_3}(-5H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-4H-L), & \mathcal{F}(-4H), & T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-5H+L) & \\
& \mathcal{O}_{\check{\mathscr{X}}_3}(-4H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-3H-L), & \mathcal{F}(-3H), & T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-4H+L) & \\
& \mathcal{O}_{\check{\mathscr{X}}_3}(-3H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-2H-L), & \mathcal{F}(-2H), & T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-3H+L) & \\
& \mathcal{O}_{\check{\mathscr{X}}_3}(-2H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-H-L), & \mathcal{F}(-H), & T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-2H+L) & \\
& \mathcal{O}_{\check{\mathscr{X}}_3}(-H), & \mathcal{O}_{\check{\mathscr{X}}_3}(-L), & \mathcal{F}, & T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-H+L), & \mathcal{C}\rangle.
\end{array}$$

Note that the restriction of the gray part of (3.6) corresponds to a part of the r.h.s. of (3.5).

It remains to show the fullness of the collection $\iota_*\mathcal{C}_1(-2), \mathcal{A}_n(-n), \ldots, \mathcal{A}_1(-1), \mathcal{A}_0$, equivalently, $\mathcal{C} = 0$. Following the inductive argument of Kuznetsov in the proof of [20, Thm. 4.1], we reduce the proof for $\check{\mathscr{X}}_3$ to the fullness of the collection for $\check{\mathscr{X}}_2$, and then the proof for $\check{\mathscr{X}}_4$ to the fullness of the collection for $\check{\mathscr{X}}_3$. For this, we take an n-dimensional vector subspace $V' \subset V$. Then we simply denote $\mathbb{P}(\mathsf{S}^2\mathcal{F})$ over $\mathrm{G}(2, V')$ by $\check{\mathscr{X}}_{n-1}$ as a subvariety of $\check{\mathscr{X}}_n$. Let $j\colon \check{\mathscr{X}}_{n-1} \hookrightarrow \check{\mathscr{X}}_n$ be the natural closed immersion. It is well-known (see [20, Lem. 4.4]) that the Koszul resolution of $j_*\mathcal{O}_{\check{\mathscr{X}}_{n-1}}$ is the following form:

$$0 \to \mathcal{O}_{\check{\mathscr{X}}_n}(-L) \to \mathcal{F} \to \mathcal{O}_{\check{\mathscr{X}}_{n-1}} \to j_*\mathcal{O}_{\check{\mathscr{X}}_{n-1}} \to 0. \tag{3.7}$$

Then, by a similar result to [20, Lem. 4.5], we have only to show $j^*\mathcal{E} = 0$ for any object $\mathcal{E}$ of $\mathcal{C}$ since we may choose V' freely and we may assume the fullness of the collection for $\check{\mathscr{X}}_{n-1}$. For this, arguing as in [20, p.165], we have only to show the following claim by (3.7):

Lemma 3.8. *The following sheaves of the form* $\mathcal{P} \otimes \mathcal{Q}$ *are contained in* $\mathcal{C}^{\perp}$*:*

- $(n = 3)$ $\mathcal{P}$ *is one of the sheaves in the gray part of* (3.5)*, namely,*
$$\mathcal{P} = \mathcal{O}_{\check{\mathscr{X}}_3}(-iH)\,(1 \le i \le 3),\ \mathcal{O}_{\check{\mathscr{X}}_3}(-iH - L)\,(0 \le i \le 2),\ \mathcal{F}(-iH)\,(0 \le i \le 2),$$
$\mathcal{Q}$ is one of the sheaves in the exact sequence (3.7) *except* $j_*\mathcal{O}_{\check{\mathscr{X}}_2}$*, namely,*
$$\mathcal{Q} = \mathcal{O}_{\check{\mathscr{X}}_3}(-L),\ \mathcal{F},\ \mathcal{O}_{\check{\mathscr{X}}_3}.$$
- $(n = 4)$ $\mathcal{P}$ *is one of the sheaves in the gray part of* (3.6)*, namely,*
$$\mathcal{P} = \mathcal{O}_{\check{\mathscr{X}}_4}(-iH)\,(1 \le i \le 4),\ \mathcal{O}_{\check{\mathscr{X}}_4}(-iH - L)\,(0 \le i \le 3),\ \mathcal{F}(-iH)\,(0 \le i \le 3),$$
$$T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-iH + L)\,(i = 1, 2),$$
$\mathcal{Q}$ is one of the sheaves in the exact sequence (3.7) *except* $j_*\mathcal{O}_{\check{\mathscr{X}}_3}$*, namely,*
$$\mathcal{Q} = \mathcal{O}_{\check{\mathscr{X}}_4}(-L),\ \mathcal{F},\ \mathcal{O}_{\check{\mathscr{X}}_4}.$$

To show Lemma 3.8, we prepare the following three results:

Lemma 3.9. *We denote by* $H_{\mathbb{P}(\mathcal{F})}$ *the tautological divisor of* $E_f \simeq \mathbb{P}(\mathcal{F})$*. For any* $k \in \mathbb{Z}$*, there exist the following exact sequences:*

$$0 \to \mathcal{O}_{\check{\mathscr{X}}}(-2H - kL) \to \mathcal{O}_{\check{\mathscr{X}}}(-(2+k)L) \to \mathcal{O}_{E_f}(-(2+k)L) \to 0, \tag{3.8}$$

$$0 \to \mathcal{F}(-H - kL) \to \mathcal{F}(-(k+1)L) \to \mathcal{O}_{E_f}(H_{\mathbb{P}(\mathcal{F})} - (k+2)L) \to 0, \tag{3.9}$$

$$\begin{aligned} &0 \to T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-2H - kL) \to \\ &\qquad T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H - (k+1)L) \to \mathcal{O}_{E_f}(2H_{\mathbb{P}(\mathcal{F})} - (k+3)L) \to 0. \end{aligned} \tag{3.10}$$

$$0 \to \mathcal{O}_{\check{\mathscr{X}}}(-H) \to \mathsf{S}^2\mathcal{F} \to T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H) \to 0, \tag{3.11}$$

$$0 \to T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H) \to \mathsf{S}^2\mathcal{F}(H - L) \to \mathcal{O}_{\check{\mathscr{X}}}(2H - 3L) \to 0, \tag{3.12}$$

Proof. Noting that

$$E_f \sim 2(H - L) \quad ([14, \S 2.1]), \tag{3.13}$$

(3.8) is obtained from the standard exact sequence $0 \to \mathcal{O}_{\check{\mathscr{X}}}(-E_f) \to \mathcal{O}_{\check{\mathscr{X}}} \to \mathcal{O}_{E_f} \to 0$ by tensoring $\mathcal{O}_{\check{\mathscr{X}}}(-(k+2)L)$. (3.11) is nothing but the Euler sequence. (3.12) is obtained by dualizing and twisting (3.11).

We will construct the exact sequence (3.9). Twisting $\mathcal{O}_{\check{\mathscr{X}}_n}(kL)$, it suffices to show the existence of the exact sequence

$$0 \to \mathcal{F}(-H) \to \mathcal{F}(-L) \to \mathcal{O}_{E_f}(H_{\mathbb{P}(\mathcal{F})} - 2L) \to 0, \tag{3.14}$$

where we note that $\mathcal{O}_{\check{\mathscr{X}}_n}(H)|_{E_f} \simeq \mathcal{O}_{E_f}(2H_{\mathbb{P}(\mathcal{F})})$. The construction below is nothing but a relativization of the Kapranov's construction of the spinor sheave $\mathcal{O}_{\mathbb{P}^1}(1)$ on a plane conic. By the Littlewood-Richardson rule, we have $\mathsf{S}^2\mathcal{F} \otimes \mathcal{F} \simeq \mathsf{S}^3\mathcal{F} \oplus \mathcal{F}(-1)$ on $\mathrm{G}(2,V)$. Therefore we have a map $p\colon \mathsf{S}^2\mathcal{F} \otimes \mathcal{F} \to \mathcal{F}(-1)$ by the projection to the second factor. Let $[V_2] \in \mathrm{G}(2,V)$ be any point. It is convenient to identify $\mathsf{S}^k V_2$ with the spaces of binary k-forms with variables x, y. Then the map p coincides up to constant with the $\mathrm{SL}\,(V_2)$-equivariant map $\delta\colon \mathsf{S}^2V_2 \otimes V_2 \to V_2$ such that

$$\delta(f, g) = \frac{\partial f}{\partial x}\frac{\partial g}{\partial y} - \frac{\partial f}{\partial y}\frac{\partial g}{\partial x}$$

for $f \in \mathsf{S}^2V_2$ and $g \in V_2$. Computing explicitly, we see that the composite

$$\mathsf{S}^2V_2 \otimes \mathsf{S}^2V_2 \otimes V_2 \xrightarrow{1\otimes\delta} \mathsf{S}^2V_2 \otimes V_2 \xrightarrow{\delta} V_2$$

satisfies $(f,f,g) \mapsto (b^2-4ac)g$, where $f = ax^2+bxy+cy^2$. Since $\mathsf{S}^2(\mathsf{S}^2V_2) \simeq \mathsf{S}^4V_2 \oplus \mathbb{C}$ as an $\mathrm{SL}\,(V_2)$-module, the map $\mathsf{S}^2V_2 \otimes \mathsf{S}^2V_2 \to \mathbb{C}$ satisfying $(f,f) \mapsto b^2-4ac$ corresponding to the projection $\mathsf{S}^2(\mathsf{S}^2V_2) \to \mathbb{C}$ to the second factor. Therefore the composite

$$\mathsf{S}^2\mathcal{F} \otimes \mathsf{S}^2\mathcal{F} \otimes \mathcal{F} \xrightarrow{1\otimes p} \mathsf{S}^2\mathcal{F} \otimes \mathcal{F}(-1) \xrightarrow{p} \mathcal{F}(-2)$$

coincides with the map $\mathsf{S}^2\mathcal{F} \otimes \mathsf{S}^2\mathcal{F} \otimes \mathcal{F} \to \mathcal{O}_{\mathrm{G}(2,V)}(-2) \otimes \mathcal{F}$ induced from the projection

$$\mathsf{S}^2\mathcal{F} \otimes \mathsf{S}^2\mathcal{F} \to \mathsf{S}^2(\mathsf{S}^2\mathcal{F}) \simeq \mathsf{S}^4\mathcal{F} \oplus \mathcal{O}_{\mathrm{G}(2,V)}(-2) \to \mathcal{O}_{\mathrm{G}(2,V)}(-2). \tag{3.15}$$

Since the map $\mathsf{S}^2(\mathsf{S}^2\mathcal{F}) \to \mathcal{O}_{\mathrm{G}(2,V)}(-2)$ corresponds to the conic fibration $E_f \to \mathrm{G}(2,V)$, we see that p is the Clifford multiplication associated to $E_f \to \mathrm{G}(2,V)$. Therefore, by the construction of the spinor sheaf $\mathcal{O}_{\mathbb{P}^1}(1)$ on a plane conic, we see that the map on $\check{\mathscr{X}}$

$$\mathcal{O}_{\check{\mathscr{X}}}(-H) \otimes \mathcal{F} \hookrightarrow \mathsf{S}^2\mathcal{F} \otimes \mathcal{F} \xrightarrow{p} \mathcal{F}(-L)$$

is injective and the cokernel $\mathcal{L}$ is an invertible sheave on E_f of the form $\mathcal{O}_{E_f}(H_{\mathbb{P}(\mathcal{F})} + aL)$ with some $a \in \mathbb{Z}$. Since the induced map $\mathcal{F}(-L) \to \mathcal{L}$ is $\mathrm{SL}\,(V)$-equivariant, we see that $a=-2$. Therefore we have obtained the desired exact sequence (3.14).

The construction of (3.10) is similar to that of (3.9), so we only give a sketch below. Twisting $\mathcal{O}_{\check{\mathscr{X}}_n}(kL)$, it suffices to show the existence of the exact sequence

$$0 \to T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-2H) \to T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H-L) \to \mathcal{O}_{E_f}(2H_{\mathbb{P}(\mathcal{F})} - 3L) \to 0. \tag{3.16}$$

By the Littlewood-Richardson rule, we have $\mathsf{S}^2\mathcal{F} \otimes \mathsf{S}^2\mathcal{F} \simeq \mathsf{S}^4\mathcal{F} \oplus \mathsf{S}^2\mathcal{F}(-1) \oplus \mathcal{O}_{\mathrm{G}(2,V)}(-2)$ on $\mathrm{G}(2,V)$. Therefore we have a map $q\colon \mathsf{S}^2\mathcal{F} \otimes \mathsf{S}^2\mathcal{F} \to \mathsf{S}^2\mathcal{F}(-1)$ by the projection to the middle factor. We see that this map is locally defined as the map δ above. Now we consider the composite of the maps on $\check{\mathscr{X}}$

$$\mathcal{O}_{\check{\mathscr{X}}}(-H) \otimes \mathsf{S}^2\mathcal{F} \hookrightarrow \mathsf{S}^2\mathcal{F} \otimes \mathsf{S}^2\mathcal{F} \xrightarrow{q} \mathsf{S}^2\mathcal{F}(-L).$$

Then, by local computations, we see that the restriction of this map to $\mathcal{O}_{\check{\mathscr{X}}}(-H) \otimes \mathcal{O}_{\check{\mathscr{X}}}(-H)$ is zero. Therefore, noting $\mathsf{S}^2\mathcal{F}/\mathcal{O}_{\check{\mathscr{X}}}(-H) \simeq T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H)$, we have the following map:

$$\overline{q}\colon \mathcal{O}_{\check{\mathscr{X}}}(-H) \otimes T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H) \to \mathsf{S}^2\mathcal{F}(-L) \to T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H-L).$$

We consider the composite

$$\begin{aligned} &\mathcal{O}_{\check{\mathscr{X}}}(-H) \otimes \mathcal{O}_{\check{\mathscr{X}}}(-H) \otimes T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H) \xrightarrow{1\otimes\overline{q}} \\ &\qquad \mathcal{O}_{\check{\mathscr{X}}}(-H) \otimes T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H-L) \xrightarrow{\overline{q}} T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H-2L). \end{aligned} \tag{3.17}$$

Note that, by (3.13), we obtain a map

$$\mathcal{O}_{\check{\mathscr{X}}}(-2H) \to \mathcal{O}_{\check{\mathscr{X}}}(-2L) \tag{3.18}$$

twisting the natural map $\mathcal{O}_{\check{\mathscr{X}}}(-E_f) \hookrightarrow \mathcal{O}_{\check{\mathscr{X}}}$ with $\mathcal{O}_{\check{\mathscr{X}}}(-2L)$. As in the case of (3.10), we see by local computations that (3.17) coincides with the map (3.18) $\otimes$ $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H)$. Therefore, $\overline{q}$ is a Clifford multiplication. Again, by local computations, we see that $\overline{q}$ is injective and the cokernel $\mathcal{M}$ is an invertible sheave on E_f of the form $\mathcal{O}_{E_f}(2H_{\mathbb{P}(\mathcal{F})} + bL)$ with some $b \in \mathbb{Z}$. Since the induced map

$T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H-L) \to \mathcal{M}$ is $\mathrm{SL}\,(V)$-equivariant, we see that $b=-3$. Therefore we have obtained the desired exact sequence (3.16).

□

Corollary 3.10. *For $n=3,4$, the following sheaves are contained in $\mathcal{C}^{\perp}$:*

(1) $\mathcal{O}_{\check{\mathscr{X}}_n}(-iH-2L)$ *for* $n=3,4$ *and* $-1 \le i \le n-1$.

(2) $\mathcal{O}_{\check{\mathscr{X}}_4}(-iH-3L)$ *for* $n=4$ *and* $-2 \le i \le 2$.

(3) $\mathcal{F}(-iH-L)$ *for* $n=3,4$ *and* $-1 \le i \le n-1$.

(4) $\mathcal{F}(-iH-2L)$ *for* $n=4$ *and* $-2 \le i \le 2$.

(5) $T_{\check{\mathscr{X}}_n/\mathrm{G}(2,V)}(-iH)$ *for* $n=3$ *and* $i=0,1$, *and* $n=4$ *and* $0 \le i \le 4$.

(6) $T_{\check{\mathscr{X}}_4/\mathrm{G}(2,V)}(-iH-L)$ *for* $n=4$ *and* $-1 \le i \le 3$.

Proof. All the assertions can be proved in a similar way by using the exact sequences in Lemma 3.9. Thus it should suffice to prove some of them.

To show (3), we consider (3.9) $\otimes\, \mathcal{O}_{\check{\mathscr{X}}_3}(-iH)$ with $k=0$:

$$0 \to \mathcal{F}(-(i+1)H) \to \mathcal{F}(-iH-L) \to \mathcal{O}_{E_f}((-2i+1)H_{\mathbb{P}(\mathcal{F})}-2L) \to 0.$$

Since $\mathcal{O}_{E_f}((-2i+1)H_{\mathbb{P}(\mathcal{F})}-2L) \in \iota_*\mathcal{C}(-2) \subset \mathcal{C}^{\perp}$, and $\mathcal{F}(-(i+1)H) \in \mathcal{C}^{\perp}$ for $0 \le i+1 \le n$ by (3.5), we have $\mathcal{F}(-iH-L) \in \mathcal{C}^{\perp}$ for $-1 \le i \le n-1$.

To show (4), we consider (3.9) $\otimes\, \mathcal{O}_{\check{\mathscr{X}}_3}(-iH)$ with $k=1$:

$$0 \to \mathcal{F}(-(i+1)H-L) \to \mathcal{F}(-iH-2L) \to \mathcal{O}_{E_f}((-2i+1)H_{\mathbb{P}(\mathcal{F})}-3L) \to 0.$$

Since $\mathcal{O}_{E_f}((-2i+1)H_{\mathbb{P}(\mathcal{F})}-3L) \in \iota_*\mathcal{C}(-2) \subset \mathcal{C}^{\perp}$ for $n=4$, and $\mathcal{F}(-(i+1)H-L) \in \mathcal{C}^{\perp}$ for $-1 \le i+1 \le 3$ by (3) as we have proved, we have $\mathcal{F}(-iH-2L) \in \mathcal{C}^{\perp}$ for $-2 \le i \le 2$. □

Lemma 3.11. (1) *For $n=3$, there exist the following exact sequences*:

$$0 \to \mathsf{S}^2\mathcal{F} \to V \otimes \mathcal{F} \to \wedge^2 V \otimes \mathcal{O}_{\check{\mathscr{X}}_3} \to \mathcal{O}_{\check{\mathscr{X}}_3}(L) \to 0, \tag{3.19}$$

$$0 \to \mathcal{O}_{\check{\mathscr{X}}_3}(-3L) \to \wedge^2 V^* \otimes \mathcal{O}_{\check{\mathscr{X}}_3}(-2L) \to V^* \otimes \mathcal{F}(-L) \to \mathsf{S}^2\mathcal{F} \to 0. \tag{3.20}$$

(2) *For $n=4$, there exist the following exact sequences*:

$$\begin{aligned} 0 \to \mathsf{S}^2\mathcal{F} \to V \otimes \mathcal{F} \to \wedge^2 V \otimes \mathcal{O}_{\check{\mathscr{X}}_4} \to \\ V^* \otimes \mathcal{O}_{\check{\mathscr{X}}_4}(L) \to \mathcal{F}^*(L) \to 0 \end{aligned} \tag{3.21}$$

$$\begin{aligned} 0 \to \mathcal{O}_{\check{\mathscr{X}}_4}(-4L) \to \wedge^3 V^* \otimes \mathcal{O}_{\check{\mathscr{X}}_4}(-3L) \to \\ \wedge^2 V^* \otimes \mathcal{F}(-2L) \to V^* \otimes \mathsf{S}^2\mathcal{F}(-L) \to \mathsf{S}^3\mathcal{F} \to 0. \end{aligned} \tag{3.22}$$

Proof. See [20, the proof of Lem. 4.3]. □

Proof of Lemma 3.8. First we assume that $n=3$.

Case $\mathcal{Q}=\mathcal{O}_{\check{\mathscr{X}}_3}$. The assertion holds since $\mathcal{P} \in \mathcal{C}^{\perp}$.

Case $\mathcal{Q}=\mathcal{O}_{\check{\mathscr{X}}_3}(-L)$. If $\mathcal{P}=\mathcal{O}_{\check{\mathscr{X}}_3}(-iH)$ $(1 \le i \le 3)$, then $\mathcal{P}(-L)=\mathcal{O}_{\check{\mathscr{X}}_3}(-iH-L) \in \mathcal{C}^{\perp}$ by (3.5). If $\mathcal{P}=\mathcal{O}_{\check{\mathscr{X}}_3}(-iH-L)$ $(0 \le i \le 2)$, then $\mathcal{P}(-L)=\mathcal{O}_{\check{\mathscr{X}}_3}(-iH-2L) \in \mathcal{C}^{\perp}$ by Corollary 3.10 (1). If $\mathcal{P}=\mathcal{F}(-iH)$ $(0 \le i \le 2)$, then $\mathcal{P}(-L)=\mathcal{F}(-iH-L) \in \mathcal{C}^{\perp}$ by Corollary 3.10 (3).

Case $\mathcal{Q}=\mathcal{F}$. If $\mathcal{P}=\mathcal{O}_{\check{\mathscr{X}}_3}(-iH)$ $(1 \le i \le 3)$, then $\mathcal{F} \otimes \mathcal{P}=\mathcal{F}(-iH) \in \mathcal{C}^{\perp}$ by (3.5). If $\mathcal{P}=\mathcal{O}_{\mathscr{X}_3}(-iH-L)$ $(0 \le i \le 2)$, then $\mathcal{F} \otimes \mathcal{P} \simeq \mathcal{F}(-iH-L) \in \mathcal{C}^{\perp}$ by Corollary 3.10 (3). Finally we assume that $\mathcal{P}=\mathcal{F}(-iH)$ $(0 \le i \le 2)$. We note that $\mathcal{F} \otimes \mathcal{F}(-iH) \simeq$

$\mathcal{O}_{\check{\mathscr{X}}_3}(-iH-L)\oplus\mathsf{S}^2\mathcal{F}(-iH)$. Since $\mathcal{O}_{\check{\mathscr{X}}_3}(-iH-L)\in\mathcal{C}^{\perp}$ by (3.5), it remains to show $\mathsf{S}^2\mathcal{F}(-iH)\in\mathcal{C}^{\perp}$. For $\mathsf{S}^2\mathcal{F}$, it suffices to show that $\mathcal{O}_{\check{\mathscr{X}}_3}(-H)$, $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H)\in\mathcal{C}^{\perp}$ by (3.11). By (3.5), $\mathcal{O}_{\check{\mathscr{X}}_3}(-H)\in\mathcal{C}^{\perp}$. Moreover, by Corollary 3.10 (5), we see that $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-H)\in\mathcal{C}^{\perp}$. The argument for $\mathsf{S}^2\mathcal{F}(-iH)$ $(i=1,2)$ is slightly involved. We use also Lemma 3.11. By considering $(3.19)\otimes\mathcal{O}_{\check{\mathscr{X}}_3}(-iH)$, we are reduced to show $\mathcal{F}(-iH)$, $\mathcal{O}_{\check{\mathscr{X}}_3}(-iH)$, $\mathcal{O}_{\check{\mathscr{X}}_3}(-iH+L)\in\mathcal{C}^{\perp}$. By (3.5), $\mathcal{F}(-iH),\mathcal{O}_{\check{\mathscr{X}}_3}(-iH)\in\mathcal{C}^{\perp}$. For $\mathcal{O}_{\check{\mathscr{X}}_3}(-iH+L)$, we consider $(3.11)\otimes\mathcal{O}_{\check{\mathscr{X}}_3}(-(i-1)H+L)$. Then we are reduce to show that $\mathsf{S}^2\mathcal{F}(-(i-1)H+L)\in\mathcal{C}^{\perp}$ since $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-iH+L)\in\mathcal{C}^{\perp}$ by (3.5). For $\mathsf{S}^2\mathcal{F}(-(i-1)H+L)$, we consider $(3.20)\otimes\mathcal{O}_{\check{\mathscr{X}}_3}(-(i-1)H+L)$. Then we are reduced to show that $\mathcal{O}_{\check{\mathscr{X}}_3}(-(i-1)H-2L)$, $\mathcal{O}_{\check{\mathscr{X}}_3}(-(i-1)H-L)$, $\mathcal{F}(-(i-1)H)\in\mathcal{C}^{\perp}$. The latter two sheaves is contained in $\mathcal{C}^{\perp}$ by (3.5), and $\mathcal{O}_{\check{\mathscr{X}}_3}(-(i-1)H-2L)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (1).

Next we consider the case $n=4$.

Case $\mathcal{Q}=\mathcal{O}_{\check{\mathscr{X}}_4}$. The assertion holds since $\mathcal{P}\in\mathcal{C}^{\perp}$.

Case $\mathcal{Q}=\mathcal{O}_{\check{\mathscr{X}}_4}(-L)$. If $\mathcal{P}=\mathcal{O}_{\check{\mathscr{X}}_4}(-iH)\,(1\le i\le 4)$, then $\mathcal{P}(-L)=\mathcal{O}_{\check{\mathscr{X}}_4}(-iH-L)\in\mathcal{C}^{\perp}$ by (3.6). If $\mathcal{P}=\mathcal{O}_{\check{\mathscr{X}}_4}(-iH-L)$ $(0\le i\le 3)$, then $\mathcal{P}(-L)=\mathcal{O}_{\check{\mathscr{X}}_4}(-iH-2L)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (1). If $\mathcal{P}=\mathcal{F}(-iH)$ $(0\le i\le 3)$, then $\mathcal{P}(-L)=\mathcal{F}(-iH-L)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (3). If $\mathcal{P}=T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-iH+L)$ $(i=1,2)$, then $\mathcal{P}(-L)=T_{\check{\mathscr{X}}_3/\mathrm{G}(2,V)}(-iH)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (5).

Case $\mathcal{Q}=\mathcal{F}$. If $\mathcal{P}=\mathcal{O}_{\check{\mathscr{X}}_4}(-iH)$ $(1\le i\le 4)$, then $\mathcal{F}\otimes\mathcal{P}=\mathcal{F}(-iH)\in\mathcal{C}^{\perp}$ by (3.6). If $\mathcal{P}=\mathcal{O}_{\mathscr{X}_4}(-iH-L)$ $(0\le i\le 3)$, then $\mathcal{F}\otimes\mathcal{P}\simeq\mathcal{F}(-iH-L)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (3). For $\mathcal{P}=\mathcal{F}(-iH)$ $(0\le i\le 3)$, we note that $\mathcal{F}\otimes\mathcal{F}(-iH)\simeq\mathcal{O}_{\check{\mathscr{X}}_4}(-iH-L)\oplus\mathsf{S}^2\mathcal{F}(-iH)$. By (3.5), $\mathcal{O}_{\check{\mathscr{X}}_4}(-iH-L)\in\mathcal{C}^{\perp}$. For $\mathsf{S}^2\mathcal{F}(-iH)\in\mathcal{C}^{\perp}$, we consider $(3.11)\otimes\mathcal{O}_{\check{\mathscr{X}}_4}(-iH)$. Then it suffices to show that $\mathcal{O}_{\check{\mathscr{X}}_4}(-(i+1)H),T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-(i+1)H)\in\mathcal{C}^{\perp}$. $\mathcal{O}_{\check{\mathscr{X}}_4}(-(i+1)H)\in\mathcal{C}^{\perp}$ by (3.6). We have $T_{\check{\mathscr{X}}/\mathrm{G}(2,V)}(-(i+1)H)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (5). Finally we assume that $\mathcal{P}=T_{\check{\mathscr{X}}_4/\mathrm{G}(2,V)}(-iH+L)$ $(i=1,2)$. The argument below is slightly involved. Considering $(3.12)\otimes\mathcal{F}(-(i-1)H+L)$, we are reduced to show that $\mathsf{S}^2\mathcal{F}\otimes\mathcal{F}(-(i-2)H)$, $\mathcal{F}(-(i-3)H-2L)\in\mathcal{C}^{\perp}$. We have $\mathcal{F}(-(i-3)H-2L)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (4). As for $\mathsf{S}^2\mathcal{F}\otimes\mathcal{F}(-(i-2)H)$, we note that the decomposition $\mathsf{S}^2\mathcal{F}\otimes\mathcal{F}(-(i-2)H)\simeq\mathsf{S}^3\mathcal{F}(-(i-2)H)\oplus\mathcal{F}(-L-(i-2)H)$. We have $\mathcal{F}(-L-(i-2)H)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (3). Now we show that $\mathsf{S}^3\mathcal{F}(-(i-2)H)\in\mathcal{C}^{\perp}$. Considering $(3.22)\otimes\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-2)H)$, we are reduced to show that $\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-2)H-4L),\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-2)H-3L),\mathcal{F}(-(i-2)H-2L),\mathsf{S}^2\mathcal{F}(-(i-2)H-L)\in\mathcal{C}^{\perp}$. We have $\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-2)H-3L)$ and $\mathcal{F}(-(i-2)H-2L)\in\mathcal{C}^{\perp}$ by Corollary 3.10 (2) and (4) respectively. As for $\mathsf{S}^2\mathcal{F}(-(i-2)H-L)$, considering $(3.11)\otimes\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-2)H-L)$, we are reduce to show $\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-1)H-L)\in\mathcal{C}^{\perp}$, which follows from (3.6), and $T_{\check{\mathscr{X}}_4/\mathrm{G}(2,V)}(-(i-1)H-L)\in\mathcal{C}^{\perp}$, which follows from Corollary 3.10 (6). To show that $\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-2)H-4L)\in\mathcal{C}^{\perp}$, we consider $(3.12)\otimes\mathcal{O}_{\check{\mathscr{X}}_4}(-iH-L)$. Then we are reduced to show that $T_{\check{\mathscr{X}}_4/\mathrm{G}(2,V)}(-(i+1)H-L)\in\mathcal{C}^{\perp}$, which follows from Corollary 3.10 (6), and $\mathsf{S}^2\mathcal{F}(-(i-1)H-2L)\in\mathcal{C}^{\perp}$. For the latter, we consider $(3.21)\otimes\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-1)H-2L)$. Then we are reduced to show that $\mathcal{F}(-(i-1)H-2L),\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-1)H-2L),\mathcal{O}_{\check{\mathscr{X}}_4}(-(i-1)H-L),\mathcal{F}(-(i-1)H)\in\mathcal{C}^{\perp}$, which follow from Corollary 3.10 (4) and (1), and (3.6), respectively. $\square$

Now we have finished our proof of Theorem 3.7. □

Remark 3.12. We believe that a similar method work for any n as in [20] once we can find a suitable candidate of the dual Lefschetz collection of maximal length.

4. Locally free sheaves $\tilde{\mathcal{S}}_L$, $\tilde{\mathcal{Q}}$, $\tilde{\mathfrak{Q}}$ on $\widetilde{\mathscr{Y}}$

In this section, n is any integer greater than or equal to 3.

4.1. Birational geometry of the double symmetric loci T_4.

As in [14, §3.4], we set

$$\mathscr{H} := \mathrm{S}_4,\ \mathscr{U} := \widetilde{\mathrm{S}}_4,\ \mathscr{Y} := \mathrm{T}_4,\ \mathscr{Z} := \mathrm{U}_4,$$

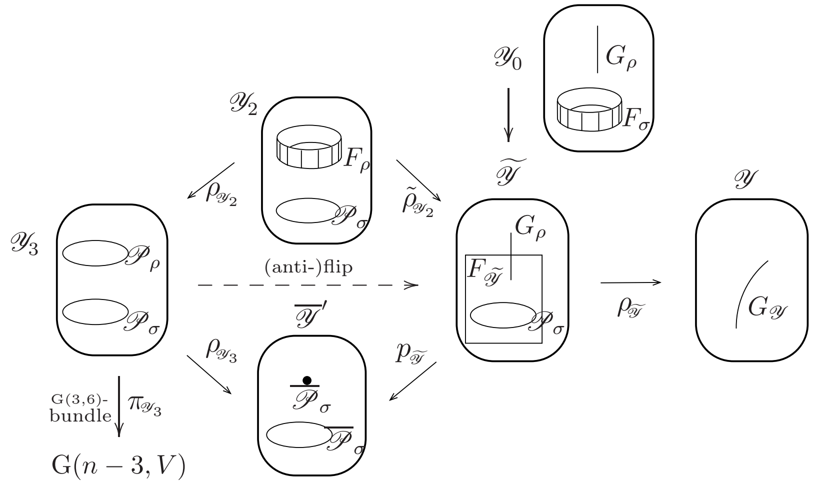
where T_4 is the double cover of S_4 branched along S_3. We quickly review the main result of [14], which describe the birational geometry of $\mathscr{Y}$.

Let

$$\mathscr{Y}_3 := \mathrm{G}(3, \wedge^2\mathfrak{Q})$$

with the universal quotient bundle $\mathfrak{Q}$ of $\mathrm{G}(n-3, V)$. In case $n = 3$, we consider $\mathrm{G}(n-3, V)$ is a point and $\mathfrak{Q}$ is the vector space V. We denote by $\mathscr{P}_\rho$ and $\mathscr{P}_\sigma$ the subvarieties of $\mathscr{Y}_3$ parameterizing ρ-planes and σ-planes respectively (we refer for the definitions of ρ-planes and σ-planes to [14, §4.1]). In [ibid., §4.5], we have seen that $\mathscr{P}_\rho \simeq \mathrm{F}(n-3, n-2; V)$ and $\mathscr{P}_\sigma \simeq \mathrm{F}(n-3, n; V)$, where $\mathrm{F}(a, b; V) := \{(\mathbb{C}^a, \mathbb{C}^b) \mid \mathbb{C}^a \subset \mathbb{C}^b \subset V\}$ is the flag variety.

In [ibid.], we construct the following diagram:



where

- $\overline{\mathscr{Y}}'$ is the normalization of the subvariety $\overline{\mathscr{Y}}$ of $\mathrm{G}(3, \wedge^{n-1}V)$ parametrizing 3-planes annihilated by at least $n-3$ linearly independent vectors in V by the wedge product ([ibid., Prop. 4.8, 4.9]),
- $\mathscr{Y}_3 \to \overline{\mathscr{Y}}'$ is a small contraction contracting $\mathscr{P}_\rho$ to $\overline{\mathscr{P}}_\rho \simeq \mathrm{G}(n-2, V)$ ([ibid., Prop. 4.11]) with the isomorphic image $\overline{\mathscr{P}}_\sigma$ of $\mathscr{P}_\sigma$,
- $\mathscr{Y}_3 \dashrightarrow \widetilde{\mathscr{Y}}$ is the (anti-)flip for the small contraction $\mathscr{Y}_3 \to \overline{\mathscr{Y}}'$ ([ibid., §4.4]),
- $p_{\widetilde{\mathscr{Y}}} \colon \widetilde{\mathscr{Y}} \to \overline{\mathscr{Y}}'$ is a small contraction contracting $G_\rho \simeq \mathbb{P}(\mathsf{S}^2\mathcal{Q}_\rho^*)$ to $\overline{\mathscr{P}}_\rho \simeq \mathrm{G}(n-2, V)$, where $\mathcal{Q}_\rho$ is the universal quotient bundle on $\mathrm{G}(n-2, V)$ ([ibid., Prop. 4.15]),

- $\rho_{\mathscr{Y}_2} \colon \mathscr{Y}_2 \to \mathscr{Y}_3$ is the blow-up along the subvariety $\mathscr{P}_\rho$ ([ibid., §4.5 and §4.7]),
- $\widetilde{\rho}_{\mathscr{Y}_2} \colon \mathscr{Y}_2 \to \widetilde{\mathscr{Y}}$ is the blow-up along the subvariety G_ρ of codimension $n-2$ ([ibid., Prop. 4.22 (1)]),
- $\rho_{\widetilde{\mathscr{Y}}} \colon \widetilde{\mathscr{Y}} \to \mathscr{Y}$ is an extremal divisorial contraction with exceptional divisor $F_{\widetilde{\mathscr{Y}}}$ ([ibid., §4.6, Prop. 4.22 (2), §5]),
- $\mathscr{Y}_0 \to \widetilde{\mathscr{Y}}$ is the blow-up along the strict transform of $\mathscr{P}_\sigma$ ([ibid., §4.4, Rem. 4.23]).

Remark 4.1. In case $n=3$, we consider $\mathscr{Y}_3 = \overline{\mathscr{Y}}' = \mathrm{G}(3, \wedge^2 V)$ and $\mathscr{Y}_2 \simeq \widetilde{\mathscr{Y}}$.

In the subsequent subsections, we introduce locally free sheaves $\tilde{\mathcal{S}}_L$, $\tilde{\mathcal{Q}}$, $\tilde{\mathfrak{Q}}$ on $\widetilde{\mathscr{Y}}$, which will play central roles in our construction of the Lefschetz collection in $\mathcal{D}^b(\widetilde{\mathscr{Y}})$.

In Sections 4 and 5, and Appendix A, we use the following convention for the invertible sheaves:

L_Σ: the pull back on a variety Σ of $\mathcal{O}_{\mathrm{G}(n-3,V)}(1)$ if there is a morphism $\Sigma \to \mathrm{G}(n-3,V)$. In case $n=3$, we consider L_Σ as the trivial sheaf $\wedge^4 V \otimes \mathcal{O}_\Sigma$.

M_Σ: the pull back on a variety Σ of $\mathcal{O}_{\mathrm{S}_4}(1)$ if there is a morphism $\Sigma \to \mathrm{S}_4$.

We often omit the subscripts Σ for L_Σ and M_Σ if no confusion is likely possible.

4.2. **Locally free sheaves $\widetilde{\mathcal{S}}_L$, $\widetilde{\mathcal{Q}}$ on $\widetilde{\mathscr{Y}}$.** Consider the following universal sequence of the Grassmann bundle $\mathscr{Y}_3 = \mathrm{G}(3, \wedge^2 \mathfrak{Q})$ over $\mathrm{G}(n-3,V)$ (cf. [7, p.434]):

$$0 \to \mathcal{S} \to \pi^*_{\mathscr{Y}_3} \wedge^2 \mathfrak{Q} \to \mathcal{Q} \to 0, \tag{4.1}$$

where $\mathcal{S}$ is the relative universal subbundle of rank three and $\mathcal{Q}$ is the relative universal quotient bundle of rank three. Similarly, we denote by $\bar{\mathcal{S}}$ the universal subbundle of rank three of the Grassmannian $\mathrm{G}(3, \wedge^{n-1} V)$. Then we have

Proposition 4.2. *$\mathcal{S}(-L_{\mathscr{Y}_3})$ is the pull-back of $\bar{\mathcal{S}}$.*

Proof. We may write a point of $\mathscr{Y}_3$ by $y = ([\bar{U}], [V_{n-3}])$ with $[\bar{U}] \in \mathrm{G}(3, \wedge^2(V/V_{n-3}))$, $[V_{n-3}] \in \mathrm{G}(n-3, V)$. y is mapped to $[U] = [\bar{U} \wedge \wedge^{n-3} V_{n-3}] \in \overline{\mathscr{Y}}$. Note that $\wedge^{n-3} V_{n-3} = \pi^*_{\mathscr{Y}_3} \mathcal{O}_{\mathbb{P}(V)}(-1)|_y = -L_{\mathscr{Y}_3}|_y$. Therefore $\mathcal{S}(-L_{\mathscr{Y}_3})$ is the pull-back of $\bar{\mathcal{S}}$. □

Now we have the following proposition (and definition):

Proposition 4.3. *There exist locally free sheaves $\widetilde{\mathcal{S}}_L$ and $\widetilde{\mathcal{Q}}$ on $\widetilde{\mathscr{Y}}$ which satisfy*

$$\rho^*_{\mathscr{Y}_2} \mathcal{S}(-L_{\mathscr{Y}_2}) = \tilde{\rho}^*_{\mathscr{Y}_2} \widetilde{\mathcal{S}}_L \text{ and } \rho^*_{\mathscr{Y}_2} \mathcal{Q} = \tilde{\rho}^*_{\mathscr{Y}_2} \widetilde{\mathcal{Q}}.$$

Proof. We define $\widetilde{\mathcal{S}}_L$ to be the pullback of $\bar{\mathcal{S}}$ to $\widetilde{\mathscr{Y}}$, then the first claim is immediate by the commutativity of the morphisms in the diagram in Subsection 4.1. To see the existence of $\widetilde{\mathcal{Q}}$, consider the universal sequence (4.1) on $\mathscr{Y}_3$. Let $[V_{n-3}, V_{n-2}]$ be a point on the exceptional locus $\mathscr{P}_\rho = \mathrm{F}(n-3, n-2, V) \to \overline{\mathscr{P}}_\rho = \mathrm{G}(n-2, V)$ of the small resolution $\mathscr{Y}_3 \to \overline{\mathscr{Y}}'$. Since $\mathcal{S}|_{[V_{n-3}, V_{n-2}]} = (V/V_{n-2}) \wedge (V_{n-2}/V_{n-3})$ by [14, Prop. 4.1], we have $0 \to (V/V_{n-2}) \wedge (V_{n-2}/V_{n-3}) \to \wedge^2(V/V_{n-3}) \to \mathcal{Q}|_{[V_{n-3}, V_{n-2}]} \to 0$. Hence we have $\mathcal{Q}|_{[V_{n-3}, V_{n-2}]} \simeq \wedge^2(V/V_{n-2})$, which implies $\mathcal{Q}|_\gamma \simeq \mathcal{O}_\gamma^{\oplus 3}$ for the fiber $\gamma = \mathbb{P}^{n-3}$ of $\mathrm{F}(n-3, n-2, V) \to \mathrm{G}(n-2, V)$ over $[V_{n-2}]$. It also implies that $\rho^*_{\mathscr{Y}_2} \mathcal{Q}$ is trivial on a fiber of $\tilde{\rho}_{\mathscr{Y}_2} \colon \mathscr{Y}_2 \to \widetilde{\mathscr{Y}}$ by [14, Prop. 4.22]. The last property and Lemma 4.4 below ensure the existence of a locally free sheaf $\widetilde{\mathcal{Q}}$ on $\widetilde{\mathscr{Y}}$ such that $\rho_{\mathscr{Y}_2}^*\mathcal{Q} = \tilde{\rho}_{\mathscr{Y}_2}^*\widetilde{\mathcal{Q}}$. □

The following lemma should be well-known for experts but we give a proof for readers' convenience:

Lemma 4.4. *Let Y be a smooth projective variety and $f\colon X \to Y$ the blow-up along a smooth subvariety $S \subset Y$. Let $\mathcal{E}$ be a locally free sheaf on X of rank r such that, for any nontrivial fiber γ of f, it holds that $\mathcal{E}|_\gamma \simeq \mathcal{O}_\gamma^{\oplus r}$. Then there exists a locally free sheaf $\overline{\mathcal{E}}$ on Y such that $\mathcal{E} = f^*\overline{\mathcal{E}}$.*

Proof. We give a proof by using Mori theory. Let $\pi\colon \mathbb{P}(\mathcal{E}) \to X$ be the natural projection and H the tautological divisor. We denote by E the f-exceptional divisor and set $F := \pi^{-1}(E)$. Since $\mathcal{E}|_\gamma \simeq \mathcal{O}_\gamma^{\oplus r}$, we have $\pi^{-1}(\gamma) \simeq \mathbb{P}^{r-1} \times \gamma$ and $H|_{\pi^{-1}(\gamma)}$ is a divisor of type $(1,0)$. Moreover, since $K_{\mathbb{P}(\mathcal{E})} = -rH + \pi^*(\det \mathcal{E} + K_X)$, any curve in a fiber of $\pi^{-1}(\gamma) \to \mathbb{P}^{r-1}$ is negative for $K_{\mathbb{P}(\mathcal{E})}$. Therefore any curve in a fiber of $\pi^{-1}(\gamma) \to \mathbb{P}^{r-1}$ spans a $K_{\mathbb{P}(\mathcal{E})}$-negative extremal ray in $\overline{\mathrm{NE}}(\mathbb{P}(\mathcal{E})/Y)$ and a sufficient multiple of H defines a birational morphism $p\colon \mathbb{P}(\mathcal{E}) \to \overline{\mathbb{P}}$ over Y contracting fibers of $\pi^{-1}(\gamma) \to \mathbb{P}^{r-1}$. Let $q\colon \overline{\mathbb{P}} \to Y$ be the induced morphism. It is easy to see that $\overline{\mathbb{P}}$ is smooth and p is the blow-up along $p(F)$. Moreover, H is the pull-back of a Cartier divisor $\overline{H}$ on $\overline{\mathbb{P}}$ and the restriction of $\overline{H}$ to any fiber $\simeq \mathbb{P}^{r-1}$ of $\overline{\mathbb{P}} \to Y$ is $\mathcal{O}_{\mathbb{P}^{r-1}}(1)$. Therefore $\overline{\mathcal{E}} := q_*\mathcal{O}_{\overline{\mathbb{P}}}(\overline{H})$ is a locally free sheaf of rank r on Y and it holds that $\mathcal{E} \simeq f^*\overline{\mathcal{E}}$ by construction. □

4.3. **Locally free sheaf $\widetilde{\mathfrak{Q}}$ on $\widetilde{\mathscr{Y}}$.** Let us focus on the local geometry of the blow-up $\mathscr{Y}_3 \to \overline{\mathscr{Y}}'$ which is described by $\mathscr{P}_\rho = \mathrm{F}(n-3, n-2, V) \to \overline{\mathscr{P}}_\rho = \mathrm{G}(n-2, V)$. We denote the universal sub-bundles of the partial flag variety $\mathrm{F}(n-3, n-2, V)$ by $\mathcal{R}_{n-3} \subset \mathcal{R}_{n-2} \subset \mathcal{R}_V$, where we set $\mathcal{R}_V := V \otimes \mathcal{O}_{F(n-3,n-2,V)}$ and $\operatorname{rank} \mathcal{R}_k = k$. There is an exact sequence

$$0 \to \mathcal{R}_{n-2}/\mathcal{R}_{n-3} \to \mathcal{R}_V/\mathcal{R}_{n-3} \to \mathcal{R}_V/\mathcal{R}_{n-2} \to 0. \tag{4.2}$$

It is also useful to identify $\mathscr{P}_\rho$ with the projective bundle $\mathbb{P}(\mathfrak{Q})$ over $\mathrm{G}(n-3, V)$. Then the exact sequence above is nothing but the relative Euler sequence of the projective bundle $\pi_{\mathcal{P}} : \mathbb{P}(\mathfrak{Q}) \to \mathrm{G}(n-3, V)$ with

$$\mathcal{R}_{n-2}/\mathcal{R}_{n-3} = \mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(-1),\ \mathcal{R}_V/\mathcal{R}_{n-3} = \pi_{\mathcal{P}}^*\mathfrak{Q},$$

and $\mathcal{R}_V/\mathcal{R}_{n-2}$ is the twisted relative tangent bundle $T_{\mathscr{P}_\rho/\mathrm{G}(n-2,V)}(-1)$.

Proposition 4.5. *Let $\pi_{\mathscr{Y}_2} = \pi_{\mathscr{Y}_3} \circ \rho_{\mathscr{Y}_2}$ be the composite of $\rho_{\mathscr{Y}_2} : \mathscr{Y}_2 \to \mathscr{Y}_3$ with $\pi_{\mathscr{Y}_3} : \mathscr{Y}_3 \to \mathrm{G}(n-3, V)$. Denote by $i : F_\rho \hookrightarrow \mathscr{Y}_2$ the inclusion of the exceptional divisor, and by $\rho_F : F_\rho \to \mathscr{P}_\rho \subset \mathscr{Y}_3$ the restriction $\rho_F := \rho_{\mathscr{Y}_2}|_{F_\rho}$. Then the kernel*

$$\mathfrak{R} := \operatorname{Ker}\left\{\pi_{\mathscr{Y}_2}^*\mathfrak{Q}^* \to i_* \circ \rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1)\right\}$$

is a locally free sheaf on $\mathscr{Y}_2$.

Proof. From (4.2), we have a surjection $\rho_F^*(\mathcal{R}_V/\mathcal{R}_{n-3})^* \to \rho_F^*(\mathcal{R}_{n-2}/\mathcal{R}_{n-3})^* \to 0$ and also $i_* \circ \rho_F^*(\mathcal{R}_V/\mathcal{R}_{n-3})^* \to i_* \circ \rho_F^*(\mathcal{R}_{n-2}/\mathcal{R}_{n-3})^* \to 0$. Let $\mathfrak{R}$ be the kernel of the composite of the latter and the natural surjection $\pi_{\mathscr{Y}_2}^*\mathfrak{Q}^* \to i_* \circ \rho_F^*\mathfrak{Q}^* = i_* \circ \rho_F^*(\mathcal{R}_V/\mathcal{R}_{n-3})^*$. Then we obtain the exact sequence

$$0 \to \mathfrak{R} \to \pi_{\mathscr{Y}_2}^*\mathfrak{Q}^* \to i_* \circ \rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1) \to 0. \tag{4.3}$$

By taking $\mathcal{E}xt(-,\mathcal{O}_{\mathscr{Y}_2})$ of this sequence, we see that $\mathfrak{R}$ is a locally free sheaf on $\mathscr{Y}_2$ (see [9, III, Ex 6.6]). □

Lemma 4.6. *$\mathfrak{R}|_\delta = \mathcal{O}_\delta^{\oplus 4}$ for each fiber $\delta \simeq \mathbb{P}^{n-3}$ of $F_\rho \to G_\rho$.*

Proof. Each fiber δ of $F_\rho \to G_\rho$ projects isomorphically to a fiber of $F(n-3,n-2,V) \to \mathrm{G}(n-2,V)$, and further to a copy of $\mathbb{P}^{n-3}$ in $\mathrm{G}(n-3,V)$. Therefore $\pi_{\mathscr{Y}_2}^*\mathfrak{Q}^*|_\delta \simeq \mathcal{O}_{\mathbb{P}^{n-3}}^{\oplus 3} \oplus \mathcal{O}_{\mathbb{P}^{n-3}}(-1)$ and also $\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1)|_\delta \simeq \mathcal{O}_{\mathbb{P}^{n-3}}(-1)$. By restricting the exact sequence (4.3), we obtain

$$\mathfrak{R}|_\delta \to \mathcal{O}_{\mathbb{P}^{n-3}}^{\oplus 3} \oplus \mathcal{O}_{\mathbb{P}^{n-3}}(-1) \to \mathcal{O}_{\mathbb{P}^{n-3}}(-1) \to 0,$$

which shows that there is a surjection $\mathfrak{R}|_\delta \to \mathcal{O}_{\mathbb{P}^{n-3}}^{\oplus 3}$ with its kernel being an invertible sheaf $\mathcal{L}$. Note that $\det \mathfrak{R} \simeq \mathcal{O}_{\mathscr{Y}_2}(-L_{\mathscr{Y}_2} - F_\rho)$ from (4.3). Now, since $L_{\mathscr{Y}_2}|_\delta = \mathcal{O}_\delta(1)$ by definition and also $F_\rho|_\delta = \mathcal{O}_{\mathbb{P}^{n-3}}(-1)$, we have $\det \mathfrak{R}|_\delta \simeq \mathcal{O}_\delta$ and $\mathcal{L} \simeq \mathcal{O}_\delta$. Hence $\mathfrak{R}|_\delta \simeq \mathcal{O}_\delta^{\oplus 4}$. □

Now we define $\mathfrak{Q}_2 := \mathfrak{R}^*$. From Lemmas 4.4 and 4.6, we have the following proposition (and definition):

Proposition 4.7. *There exists a locally free sheaf $\widetilde{\mathfrak{Q}}$ on $\widetilde{\mathscr{Y}}$ such that*

$$\mathfrak{Q}_2 = \tilde{\rho}_{\mathscr{Y}_2}^*\widetilde{\mathfrak{Q}}.$$

The following exact sequence will be used in our later calculations:

Proposition 4.8. *There exists the following exact sequence*:

$$0 \to \pi_{\mathscr{Y}_2}^*\mathfrak{Q} \to \mathfrak{Q}_2 \to i_* \circ \rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(-1)(F_\rho|_{F_\rho}) \to 0. \tag{4.4}$$

Proof. By taking $\mathcal{H}om(-,\mathcal{O}_{\mathscr{Y}_2})$ of (4.3), we obtain:

$$0 \to \pi_{\mathscr{Y}_2}^*\mathfrak{Q} \to \mathfrak{Q}_2 \to \mathcal{E}xt^1_{\mathcal{O}_{\mathscr{Y}_2}}(i_* \circ \rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1), \mathcal{O}_{\mathscr{Y}_2}) \to 0.$$

The claim follows by evaluating $\mathcal{E}xt^1_{\mathcal{O}_{\mathscr{Y}_2}}$ as

$$\mathcal{E}xt^1_{\mathcal{O}_{\mathscr{Y}_2}}\big(i_* \circ \rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1), \mathcal{O}_{\mathscr{Y}_2}\big) \simeq i_*\mathcal{E}xt^0_{\mathcal{O}_{F_\rho}}\big(\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1), i^*\mathcal{O}_{\mathscr{Y}_2} \otimes \omega_{F_\rho/\mathscr{Y}_2}\big),$$

where we use the Grothendieck-Verdier duality with $i^!\mathcal{Q}_{\mathscr{Y}_2} = i^*\mathcal{O}_{\mathscr{Y}_2} \otimes \omega_{F_\rho/\mathscr{Y}_2}[-1] = \mathcal{O}_{F_\rho}(F_\rho|_{F_\rho})[-1]$. □

4.4. **Properties of $\mathcal{S}^*, \mathcal{Q}$ restricted on $\mathscr{P}_\rho$ and $\mathscr{P}_\sigma$.** As in the last subsection, we identify $\mathscr{P}_\rho = \mathrm{F}(n-3,n-2,V)$ with the projective bundle $\mathbb{P}(\mathfrak{Q})$ with $\pi_{\mathcal{P}} : \mathbb{P}(\mathfrak{Q}) \to \mathrm{G}(n-3,V)$. We introduce two divisors on $\mathscr{P}_\rho$;

$$H_{\mathscr{P}_\rho} = \mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1) \ \text{ and } \ L_{\mathscr{P}_\rho} := \pi_{\mathcal{P}}^*\mathcal{O}_{\mathrm{G}(n-3,V)}(1).$$

Proposition 4.9. *$\mathcal{Q}|_{\mathscr{P}_\rho} \simeq \mathcal{S}^*(L_{\mathscr{Y}_3})|_{\mathscr{P}_\rho}$ and $\mathcal{Q}|_{\mathscr{P}_\sigma} \simeq \mathcal{S}^*(L_{\mathscr{Y}_3})|_{\mathscr{P}_\sigma}$.*

Proof. Proofs of the both relations are similar, so we only prove the former. Take a point $[\mathrm{P}_{\mathrm{V_{n-2}/V_{n-3}}}]$ of $\mathscr{P}_\rho \subset \mathrm{G}(3, \wedge^2\mathfrak{Q})$. Let W_1 and W_2 be the fiber of $\mathcal{S}^*$ and $\mathcal{Q}$ at $[\mathrm{P}_{\mathrm{V_{n-2}/V_{n-3}}}]$, respectively. We compare the restrictions of the universal exact sequence (4.1) and its dual;

$$0 \to W_1 \to \wedge^2 V/V_{n-3} \to W_2 \to 0,$$
$$0 \to (W_2)^* \to (\wedge^2 V/V_{n-3})^* \to (W_1)^* \to 0.$$

Note that $\mathbb{P}(W_1) = \mathrm{P}_{\mathrm{V_{n-2}/V_{n-3}}}$. Choose a basis $\{\bar{\mathbf{e}}_1, \bar{\mathbf{e}}_2, \bar{\mathbf{e}}_3, \bar{\mathbf{e}}_4\}$ of V/V_{n-3} so that $V_{n-2}/V_{n-3} = \langle \bar{\mathbf{e}}_1 \rangle$. Then $W_1 = \langle \bar{\mathbf{e}}_1 \wedge \bar{\mathbf{e}}_2, \bar{\mathbf{e}}_1 \wedge \bar{\mathbf{e}}_3, \bar{\mathbf{e}}_1 \wedge \bar{\mathbf{e}}_4 \rangle$. By the non-degenerate pairing $\wedge^2 V/V_{n-3} \times \wedge^2 V/V_{n-3} \to \wedge^4 V/V_{n-3} \simeq \mathbb{C}$, we may identify $\wedge^2 V/V_{n-3}$ and $(\wedge^2 V/V_{n-3})^*$. Under this identification, we see from the explicit basis of W_1 that $(W_2)^*$ coincides with W_1 since an element of $(W_2)^*$ is nothing but an element of $(\wedge^2 V/V_{n-3})^*$ vanishing on W_1. Since $\wedge^4 V/V_{n-3}$ is a fiber of $L_{\mathscr{P}_\rho}$ at $[\mathrm{P}_{\mathrm{V_{n-2}/V_{n-3}}}]$, we conclude that $\mathcal{S}|_{\mathscr{P}_\rho} \simeq \mathcal{Q}^*|_{\mathscr{P}_\rho} \otimes L_{\mathscr{P}_\rho}$. □

Proposition 4.10.
(1) $\mathcal{Q}|_{\mathscr{P}_\rho} = \wedge^2(\mathcal{R}_V/\mathcal{R}_{n-2}) \simeq (\mathcal{R}_V/\mathcal{R}_{n-2})^*(H_{\mathscr{P}_\rho} + L_{\mathscr{P}_\rho})$.
(2) $\det \mathcal{Q}|_{\mathscr{P}_\rho} = 2(H_{\mathscr{P}_\rho} + L_{\mathscr{P}_\rho})$.

Proof. (1) Since $\mathcal{Q}|_{[V_{n-3},V_{n-2}]} = \wedge^2(V/V_{n-2})$ by the proof of Proposition 4.3, and $(\mathcal{R}_V/\mathcal{R}_{n-2})|_{[V_{n-3},V_{n-2}]} = V/V_{n-2}$, we have $\mathcal{Q}|_{\mathscr{P}_\rho} = \wedge^2(\mathcal{R}_V/\mathcal{R}_{n-2})$. By taking the determinant of (4.2), we have

$$\wedge^3(\mathcal{R}_V/\mathcal{R}_{n-2}) \simeq \wedge^4(\mathcal{R}_V/\mathcal{R}_{n-3}) \otimes (\mathcal{R}_{n-2}/\mathcal{R}_{n-3})^* \simeq L_{\mathscr{P}_\rho} \otimes \mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1).$$

Therefore we obtain the isomorphism $\mathcal{Q}|_{\mathscr{P}_\rho} = \wedge^2(\mathcal{R}_V/\mathcal{R}_{n-2}) \simeq (\mathcal{R}_V/\mathcal{R}_{n-2})^*(H_{\mathscr{P}_\rho} + L_{\mathscr{P}_\rho})$. The claim (2) follows from $\det \mathcal{Q}|_{\mathscr{P}} = \wedge^3(\wedge^2(\mathcal{R}_V/\mathcal{R}_{n-2})) \simeq (\wedge^3(\mathcal{R}_V/\mathcal{R}_{n-2}))^{\otimes 2}$. □

5. Lefschetz collection in $\mathcal{D}^b(\widetilde{\mathscr{Y}})$

In this section, we assume that $n = 3, 4$. Using the sheaves $\widetilde{\mathcal{S}}_L$, $\widetilde{\mathcal{Q}}$, $\widetilde{\mathfrak{Q}}$ introduced in Section 4, we construct a Lefschetz collection in $\mathcal{D}^b(\widetilde{\mathscr{Y}})$, which shows an interesting duality between the (dual) Lefschetz collection obtained in Theorem 3.3.

5.1. Homological properties of $\widetilde{\mathcal{S}}_L$, $\widetilde{\mathcal{Q}}$, $\widetilde{\mathfrak{Q}}$.

Theorem 5.1. *Suppose* $n = 3, 4$.

(1) *The ordered sequence* $\mathcal{O}_{\widetilde{\mathscr{Y}}}$, $\widetilde{\mathfrak{Q}}$, $\widetilde{\mathcal{S}}_L^*$, *or* $\widetilde{\mathcal{Q}}$ *is semi-orthogonal.*

(2) *Let* $\widetilde{\mathcal{A}}$ *or* $\widetilde{\mathcal{B}}$ *be one of the locally free sheaves* $\mathcal{O}_{\widetilde{\mathscr{Y}}}$, $\widetilde{\mathfrak{Q}}$, $\widetilde{\mathcal{S}}_L^*$, *or* $\widetilde{\mathcal{Q}}$ *on* $\widetilde{\mathscr{Y}}$. *Then*

$$H^\bullet(\widetilde{\mathcal{A}}^* \otimes \widetilde{\mathcal{B}}(-t)) = 0 \ \textit{for} \ \begin{cases} 1 \le t \le 5 : n = 3, \\ t = 6, 7 : n = 3 \ \textit{and} \ \widetilde{\mathcal{A}} = \mathcal{O}_{\widetilde{\mathscr{Y}}}, \\ 1 \le t \le 9 : n = 4. \end{cases}$$

The rest of this section is devoted to our proof of Theorem 5.1, where we compute the cohomology groups $H^\bullet(\widetilde{\mathcal{A}}^* \otimes \widetilde{\mathcal{B}}(-t))$ for $n = 3$ and $1 \le t \le 7$ and for $n = 4$ and $1 \le t \le 9$. Our strategy is to reduce the computations of cohomology groups on $\widetilde{\mathscr{Y}}$ to those on $\mathscr{Y}_3$ and use Theorem 2.1 for the $\mathrm{G}(3,6)$-bundle $\mathscr{Y}_3 \to \mathrm{G}(n-3, V)$.

Let $\widetilde{\mathfrak{F}}$ be a locally free sheaf on $\widetilde{\mathscr{Y}}$ and $\mathfrak{F}_2 := \tilde{\rho}_{\mathscr{Y}_2}^* \widetilde{\mathfrak{F}}$. Since $\tilde{\rho}_{\mathscr{Y}_2} \colon \mathscr{Y}_2 \to \widetilde{\mathscr{Y}}$ is a blow-up of a smooth variety, it holds that

$$H^\bullet(\widetilde{\mathscr{Y}}, \widetilde{\mathfrak{F}}(-t)) \simeq H^\bullet(\mathscr{Y}_2, \mathfrak{F}_2(-t)), \tag{5.1}$$

where $(-t)$ on the right hand side represents the twist by $\mathcal{O}_{\widetilde{\mathscr{Y}_2}}(-tM_{\widetilde{\mathscr{Y}_2}})$. Therefore it suffices to compute $H^\bullet({\mathcal{A}_2}^* \otimes \mathcal{B}_2(-t))$.

5.2. **Divisors on $\mathscr{Y}_2$.** Recall the universal sequence (4.1) of the Grassmann bundle $\mathscr{Y}_3 = \mathrm{G}(3, \wedge^2\mathfrak{Q})$. Taking the determinant and using $\wedge^6(\wedge^2\mathfrak{Q}) = \mathcal{O}_{\mathscr{Y}_3}(3)$, we have

$$\det\mathcal{Q} = \det\mathcal{S}^* + 3L_{\mathscr{Y}_3} = \det\{\mathcal{S}^*(L_{\mathscr{Y}_3})\}. \tag{5.2}$$

Also, since $T_{\mathscr{Y}_3/\mathbb{P}(V)} = \mathcal{S}^* \otimes \mathcal{Q}$ (see [7, p.435]), we have

$$K_{\mathscr{Y}_3} = -\det(\mathcal{Q}\otimes\mathcal{S}^*) - (n+1)L_{\mathscr{Y}_3} = -3(\det\mathcal{Q} + \det\mathcal{S}^*) - (n+1)L_{\mathscr{Y}_3} = -6\det\mathcal{Q} + (8-n)L_{\mathscr{Y}_3}, \tag{5.3}$$

where we note $\operatorname{rank}\mathcal{S} = \operatorname{rank}\mathcal{Q} = 3$ and we use (5.2) in the last equality.

We now see some relations among divisors on $\mathscr{Y}_2$. Note that

$$K_{\mathscr{Y}_2} = \rho_{\mathscr{Y}_2}^* K_{\mathscr{Y}_3} + 5F_\rho \tag{5.4}$$

since $\rho_{\mathscr{Y}_2}$ is the blow-up along a smooth subvariety of codimension 6. By this and (5.3), we have

$$K_{\mathscr{Y}_2} = -6\rho_{\mathscr{Y}_2}^* \det\mathcal{Q} + (8-n)L_{\mathscr{Y}_2} + 5F_\rho. \tag{5.5}$$

Proposition 5.2. *The pull-back $M_{\mathscr{Y}_2}$ of $\mathcal{O}_{\mathscr{H}}(1)$ is given by*

$$M_{\mathscr{Y}_2} = \rho_{\mathscr{Y}_2}^*(\det\mathcal{Q}) - L_{\mathscr{Y}_2} - F_\rho.$$

Proof. Note that $\pi_{\mathscr{Y}_3 *}\mathcal{O}_{\mathbb{P}(\wedge^3(\wedge^2\mathfrak{Q}))}(1) = \wedge^3(\wedge^2\mathfrak{Q}^*)$, and $\pi_{\mathscr{U} *}\mathcal{O}_{\mathbb{P}(\mathsf{S}^2\mathfrak{Q}^*)}(1) = \mathsf{S}^2\mathfrak{Q}$. Therefore, by the decomposition [14, (4.5)] and the construction of $\mathscr{Y}_3 \dashrightarrow \mathscr{U}$ as a relative linear projection, we have

$$\rho_{\mathscr{Y}_2}^*(\det\mathcal{S}^*) - F_\rho = q_{\mathscr{Y}_2}^*(M_{\mathscr{U}} - 2L_{\mathscr{U}}) = M_{\mathscr{Y}_2} - 2L_{\mathscr{Y}_2}.$$

Then we have the assertion by (5.2). □

Proposition 5.3. *$\mathscr{Y}_2$ is a weak Fano manifold, namely, $-K_{\mathscr{Y}_2}$ is nef and big.*

Proof. Note that $\det\mathcal{Q}$ is nef since $\mathcal{Q}$ is the image of the surjection from the globally generated bundle $\pi_{\mathscr{Y}_3}^*\wedge^2\mathfrak{Q}$. By (5.5) and Proposition 5.2, we have $-K_{\mathscr{Y}_2} = 5M_{\mathscr{Y}_2} + (n-3)L_{\mathscr{Y}_2} + \rho_{\mathscr{Y}_2}^*\det\mathcal{Q}$, which is clearly nef, and is also big since so is $M_{\mathscr{Y}_2}$. □

Proposition 5.4. *Let $F'_{\widetilde{\mathscr{Y}}}$ be the strict transform of $F_{\widetilde{\mathscr{Y}}}$. It holds that $F'_{\widetilde{\mathscr{Y}}} = 2M_{\mathscr{Y}_2} - L_{\mathscr{Y}_2} - F_\rho$.*

Proof. By [14, Prop. 2.5, Cor. 5.2], we have

$$K_{\widetilde{\mathscr{Y}}} = \rho_{\widetilde{\mathscr{Y}}}^* K_{\mathscr{Y}} + (n-2)F_{\widetilde{\mathscr{Y}}} = -2(n+1)M_{\widetilde{\mathscr{Y}}} + (n-2)F_{\widetilde{\mathscr{Y}}}. \tag{5.6}$$

By [14, Prop. 4.21], $\widetilde{\rho}_{\mathscr{Y}_2} \colon \mathscr{Y}_2 \to \widetilde{\mathscr{Y}}$ is the blow-up along G_ρ. Therefore

$$K_{\mathscr{Y}_2} = \widetilde{\rho}_{\mathscr{Y}_2}^* K_{\widetilde{\mathscr{Y}}} + (n-3)F_\rho. \tag{5.7}$$

Since G_ρ is not contained in $F_{\widetilde{\mathscr{Y}}}$, we deduce from (5.6) and (5.7) that

$$K_{\mathscr{Y}_2} = -2(n+1)M_{\mathscr{Y}_2} + (n-2)F'_{\widetilde{\mathscr{Y}}} + (n-3)F_\rho.$$

Combining this with (5.5) and Proposition 5.2, we obtain

$$(n-2)F'_{\widetilde{\mathscr{Y}}} = (2n-4)M_{\mathscr{Y}_2} - (n-2)L_{\mathscr{Y}_2} - (n-2)F_\rho.$$

Since $\mathscr{Y}_2$ is a weak Fano manifold, $\operatorname{Pic}\mathscr{Y}_2$ is torsion-free. Therefore we obtain the desired equality.

□

5.3. **Case $\widetilde{\mathcal{A}} = \widetilde{\mathfrak{Q}}$ or $\widetilde{\mathcal{B}} = \widetilde{\mathfrak{Q}}$.** Among $\mathcal{O}_{\mathscr{Y}_2}$, $\mathfrak{Q}_2$, $\rho^*_{\mathscr{Y}_2}\mathcal{S}(-L)$, and $\rho^*_{\mathscr{Y}_2}\mathcal{Q}$, only $\mathfrak{Q}_2$ is not the pull-back of a locally free sheaf on $\mathscr{Y}_3$. We will show that to compute $H^\bullet(\mathscr{Y}_2, \mathcal{A}_2^* \otimes \mathcal{B}_2(-t))$ for $1 \le t \le 5$ and $\mathcal{A}_2 = \mathfrak{Q}_2$ or $\mathcal{B}_2 = \mathfrak{Q}_2$, we may replace $\mathfrak{Q}_2$ by $\rho^*_{\mathscr{Y}_2}\mathfrak{Q}$.

Lemma 5.5. *With the notation as in Theorem* 5.1, *it holds that*

$$H^\bullet(\mathfrak{Q}_2^* \otimes \mathcal{B}_2(-t)) \simeq H^\bullet(\pi^*_{\mathscr{Y}_2}\mathfrak{Q}^* \otimes \mathcal{B}_2(-t)), \tag{5.8}$$

$$H^\bullet(\mathcal{A}_2^* \otimes \mathfrak{Q}_2(-t)) \simeq H^\bullet(\mathcal{A}_2^* \otimes \pi^*_{\mathscr{Y}_2}\mathfrak{Q}(-t)), \tag{5.9}$$

$$H^\bullet(\mathfrak{Q}_2^* \otimes \mathfrak{Q}_2(-t)) \simeq H^\bullet(\pi^*_{\mathscr{Y}_2}\mathfrak{Q}^* \otimes \pi^*_{\mathscr{Y}_2}\mathfrak{Q}(-t)) \tag{5.10}$$

for any $\bullet$ *and* $1 \le t \le 5$. *Moreover,* (5.8) *holds also for* $t = 0$ *and* $\mathcal{B}_2 = \mathcal{O}_{\mathscr{Y}_2}$.

Proof.

Proof of (5.8). By the exact sequence (4.3), we have

$$0 \to \mathfrak{Q}_2^* \otimes \mathcal{B}_2(-t) \to \pi^*_{\mathscr{Y}_2}\mathfrak{Q}^* \otimes \mathcal{B}_2(-t) \to i_*\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1) \otimes \mathcal{B}_2(-t)|_{F_\rho} \to 0. \tag{5.11}$$

Therefore it suffices to show

$$H^\bullet(F_\rho, \rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1) \otimes \mathcal{B}_2(-t)|_{F_\rho}) = 0. \tag{5.12}$$

Note that this will imply for $\mathcal{B}_2 = \mathfrak{Q}_2$ that

$$H^\bullet(\mathfrak{Q}_2^* \otimes \mathfrak{Q}_2(-t)) \simeq H^\bullet(\pi^*_{\mathscr{Y}_2}\mathfrak{Q}^* \otimes \mathfrak{Q}_2(-t)) \tag{5.13}$$

Case $n = 4$. In this case, this vanishing holds for any t by the Leray spectral sequence for $\tilde{\rho}_{\mathscr{Y}_2}|_{F_\rho} \colon F_\rho \to G_\rho$, since $\tilde{\rho}_{\mathscr{Y}_2}|_{F_\rho}$ is a $\mathbb{P}^1$-bundle and the restriction of $\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1) \otimes \mathcal{B}_2(-t)|_{F_\rho}$ to the fiber is a direct sum of $\mathcal{O}_{\mathbb{P}^1}(-1)$ by the proof of Lemma 4.6. In particular, (5.8) holds also for $t = 0$ and $\mathcal{B}_2 = \mathcal{O}_{\mathscr{Y}_2}$ in this case.

Case $n = 3$. If $\mathcal{B}_2 = \mathcal{O}_{\mathscr{Y}_2}$, $\rho^*_{\mathscr{Y}_2}\mathcal{S}(-L)$, and $\rho^*_{\mathscr{Y}_2}\mathcal{Q}$, then the vanishing (5.12) holds for $1 \le t \le 5$ by the Leray spectral sequence for $\rho_F \colon F_\rho \to \mathscr{P}_\rho$ since ρ_F is a $\mathbb{P}^5$-bundle and the restriction of $\rho_F^*\mathcal{O}_{\mathbb{P}(V)}(1) \otimes \mathcal{B}_2(-t)|_{F_\rho}$ to its fiber is a direct sum of $\mathcal{O}_{\mathbb{P}^5}(-t)$.

Suppose $t = 0$ and $\mathcal{B}_2 = \mathcal{O}_{\mathscr{Y}_2}$. Then (5.8) holds by (5.11) since $H^\bullet(V^* \otimes \mathcal{O}_{\mathscr{Y}_2})$ and $H^\bullet(\rho_F^*\mathcal{O}_{\mathbb{P}(V)}(1))$ are isomorphic to each other for $\bullet = 0$ and are zero for $\bullet > 0$.

Suppose $\mathcal{B}_2 = \mathfrak{Q}_2$. First we calculate the restriction of $\mathfrak{Q}_2^*$ on F_ρ. By restricting (4.3) to F_ρ, we obtain the exact sequence

$$\mathfrak{Q}_2^*|_{F_\rho} \to V^* \otimes \mathcal{O}_{F_\rho} \to \rho_F^*\mathcal{O}_{\mathbb{P}(V)}(1) \to 0.$$

Since the kernel of $V^* \otimes \mathcal{O}_{F_\rho} \to \rho_F^*\mathcal{O}_{\mathbb{P}(V)}(1)$ is isomorphic to $\rho_F^*\Omega_{\mathbb{P}(V)}(1)$, we have the exact sequence

$$0 \to \mathcal{L} \to \mathfrak{Q}_2^*|_{F_\rho} \to \rho_F^*\Omega_{\mathbb{P}(V)}(1) \to 0, \tag{5.14}$$

where $\mathcal{L}$ is an invertible sheaf on F_ρ. Taking the determinants in (4.3), we have $\det \mathfrak{Q}_2^* = \mathcal{O}_{\widetilde{\mathscr{Y}}}(-F_\rho) \otimes \wedge^4 V^*$. Therefore $\mathcal{L} \simeq \mathcal{O}_{F_\rho}(-F_\rho) \otimes \rho_F^*\mathcal{O}_{\mathbb{P}(V)}(1) \otimes \wedge^4 V^*$. Now dualizing (5.14), we obtain

$$0 \to \rho_F^* T_{\mathbb{P}(V)}(-1) \to \mathfrak{Q}_2|_{F_\rho} \to \mathcal{O}_{F_\rho}(F_\rho) \otimes \rho_F^*\mathcal{O}_{\mathbb{P}(V)}(-1) \otimes \wedge^4 V \to 0. \tag{5.15}$$

Let P be a fiber of $\rho_F \colon F_\rho \to \mathscr{P}_\rho \simeq \mathbb{P}(V)$. We have the vanishing (5.12) for $1 \le t \le 4$ since the restriction to P of $\mathfrak{Q}_2|_{F_\rho}$ is isomorphic to $\mathcal{O}_P^{\oplus 3} \oplus \mathcal{O}_P(-1)$ by (5.15). Finally we consider the case where $t = 5$. By the Serre duality, it suffices to show the vanishing of

$$H^{8-\bullet}(F_\rho, \rho_F^*\mathcal{O}_{\mathbb{P}(V)}(-1) \otimes \mathfrak{Q}_2^*(-\det \mathcal{Q}_2 + F_\rho)|_{F_\rho}),$$

which can be seen by twisting (5.14) with $\rho_F^*\mathcal{O}_{\mathbb{P}(V)}(-1)\otimes\mathcal{O}_{F_\rho}(-\det\mathcal{Q}_2+F_\rho)$.

Proof of (5.9) and (5.10). By the exact sequence (4.4), we have

$$0\to\pi_{\mathscr{Y}_2}^*\mathfrak{Q}\otimes\mathfrak{F}(-t)\to\mathfrak{Q}_2\otimes\mathfrak{F}(-t)\to i_*\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(-1)\otimes\mathfrak{F}(-tM_{\mathscr{Y}_2}+F_\rho)|_{F_\rho}\to 0$$

for a locally free sheaf $\mathfrak{F}$ on $\mathscr{Y}_2$. It suffices to show the vanishings of

$$H^\bullet(F_\rho,\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(-1)\otimes\mathfrak{F}(-tM_{\mathscr{Y}_2}+F_\rho)|_{F_\rho})\ \ (1\le t\le 5)\tag{5.16}$$

with $\mathfrak{F}=\mathcal{O}_{\mathscr{Y}_2}$, $\rho_{\mathscr{Y}_2}^*\mathcal{Q}^*$, $\rho_{\mathscr{Y}_2}^*\mathcal{S}(-L_{\mathscr{Y}_2})$ for (5.9), and with $\pi_{\mathscr{Y}_2}^*\mathfrak{Q}^*$ for (5.10) in view of (5.13). Since $\mathcal{Q}^*|_{\mathcal{P}_\rho}\simeq\mathcal{S}(-L_{\mathscr{Y}_3})|_{\mathcal{P}_\rho}$ by Proposition 4.9, we have only to consider the cases $\mathfrak{F}=\mathcal{O}_{\mathscr{Y}_2}$, $\rho_{\mathscr{Y}_2}^*\mathcal{Q}^*$, $\pi_{\mathscr{Y}_2}^*\mathfrak{Q}^*$. For $1\le t\le 4$, the vanishings of (5.16) follow from the Leray spectral sequence for $\rho_F\colon F_\rho\to\mathscr{P}_\rho$ since ρ_F is a $\mathbb{P}^5$-bundle and the restriction of $\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(-1)\otimes\mathfrak{F}(-tM_{\mathscr{Y}_2}+F_\rho)|_{F_\rho}$ to the fiber is a direct sum of $\mathcal{O}_{\mathbb{P}^5}(-(t+1))$ by Proposition 5.2. For $t=5$, note that (5.16) is Serre dual to

$$H^{\bullet'}(F_\rho,\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1)\otimes\mathfrak{F}^*(\rho_{\mathscr{Y}_2}^*(-\det\mathcal{Q}-L_{\mathscr{Y}_3}))|_{F_\rho})\tag{5.17}$$

with $\bullet'=8-\bullet$ for $n=3$ and $\bullet'=12-\bullet$ for $n=4$ by (5.5) and Proposition 5.2. Since $\rho_{\mathscr{Y}_2}$ is the blow-up of a smooth variety and $\mathfrak{F}=\rho_{\mathscr{Y}_2}^*\mathfrak{F}_3$ with a locally free sheaf $\mathfrak{F}_3$ on $\mathscr{Y}_3$, each of (5.17) is isomorphic to

$$H^{\bullet'}(\mathscr{P}_\rho,\rho_F^*\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1)\otimes\mathfrak{F}_3^*(-\det\mathcal{Q}-L_{\mathscr{Y}_3})|_{\mathscr{P}_\rho}).\tag{5.18}$$

Using Proposition 4.10 (1) and (2), we can write

$$\mathcal{O}_{\mathbb{P}(\mathfrak{Q})}(1)\otimes\mathfrak{F}_3^*(-\det\mathcal{Q}-L_{\mathscr{Y}_3})|_{\mathscr{P}_\rho}=\begin{cases}\mathcal{O}_{\mathscr{P}_\rho}(-H_{\mathscr{P}_\rho}-3L_{\mathscr{P}_\rho})\text{ for }\mathfrak{F}_3=\mathcal{O}_{\mathscr{Y}_3}\\(\mathcal{R}_V/\mathcal{R}_{n-2})^*(-2L_{\mathscr{P}_\rho})\text{ for }\mathfrak{F}_3=\mathcal{Q}^*\\\pi_{\mathcal{P}}^*\mathfrak{Q}(-H_{\mathscr{P}_\rho}-3L_{\mathscr{P}_\rho})\text{ for }\mathfrak{F}_3=\pi_{\mathscr{Y}_3}^*\mathfrak{Q}^*.\end{cases}$$

We see that all $H^{\bullet'}(\mathscr{P}_\rho,-)$'s of these sheaves vanish when restricted to fibers of $\pi_{\mathcal{P}}\colon\mathscr{P}_\rho=\mathbb{P}(\mathfrak{Q})\to\mathrm{G}(n-3,V)$. Hence, by the Leray spectral sequence for $\pi_{\mathcal{P}}$, all of (5.18) vanish, too. □

5.4. **Case** $0\le t\le 5$**.** By using the following lemma, we can reduce our computations of cohomology groups to those on $\mathscr{Y}_3$ in the case where $0\le t\le 5$:

Lemma 5.6.
(1) $R^q\rho_{\mathscr{Y}_2*}\mathcal{O}_{\mathscr{Y}_2}(tF_\rho)=0$ *for any* $t\le 5$ *and* $q>0$.
(2) $\rho_{\mathscr{Y}_2*}\mathcal{O}_{\mathscr{Y}_2}(tF_\rho)=\mathcal{O}_{\mathscr{Y}_3}$ *for* $t\ge 0$.

Proof. (1) follows from the relative Kodaira vanishing theorem since $tF_\rho-K_{\mathscr{Y}_2}\equiv_{\mathscr{Y}_3}(t-5)F_\rho$ is $\rho_{\mathscr{Y}_2}$-nef and $\rho_{\mathscr{Y}_2}$-big if $t\le 5$. (2) is a standard result. □

In view of Lemma 5.5, we will replace $\mathfrak{Q}_2$ by $\rho_{\mathscr{Y}_2}^*\mathfrak{Q}$ if $\mathcal{A}_2$ or $\mathcal{B}_2=\mathfrak{Q}_2$, and write $\mathcal{A}_2$ or $\mathcal{B}_2=\rho_{\mathscr{Y}_2}^*\mathfrak{Q}$. Then, in any case, $\mathcal{A}_2$ and $\mathcal{B}_2$ are the pull-back of a locally free sheaf $\mathcal{A}_3$ and $\mathcal{B}_3$ on $\mathscr{Y}_3$. Therefore, by the Leray spectral sequence for $\rho_{\mathscr{Y}_2}$, and Proposition 5.2 and Lemma 5.6, we have the following:

Lemma 5.7.

$$H^\bullet(\mathscr{Y}_2,\mathcal{A}_2^*\otimes\mathcal{B}_2(-t))\simeq H^\bullet(\mathscr{Y}_3,\mathcal{A}_3^*\otimes\mathcal{B}_3(-t\det\mathcal{Q}+tL_{\mathscr{Y}_3}))\ \ (0\le t\le 5).\tag{5.19}$$

Proof of Theorem 5.1 for $0\le t\le 5$**.** We have only to show the vanishing of $H^\bullet(\mathscr{Y}_3,\mathcal{A}_3^*\otimes\mathcal{B}_3(-t\det\mathcal{Q}+tL_{\mathscr{Y}_3}))$ for $1\le t\le 5$ and $\mathcal{A}_3,\mathcal{B}_3=\mathcal{O}_{\mathscr{Y}_3},\mathfrak{Q},\mathcal{S}^*(L),\mathcal{Q}$, and for $t=0$ and $(\mathcal{A}_3,\mathcal{B}_3)=(\mathfrak{Q},\mathcal{O}_{\mathscr{Y}_3})$, $(\mathcal{S}^*(L),\mathcal{O}_{\mathscr{Y}_3})$, $(\mathcal{Q},\mathcal{O}_{\mathscr{Y}_3})$, $(\mathcal{S}^*(L),\mathfrak{Q})$, $(\mathcal{Q},\mathfrak{Q})$, or $(\mathcal{Q},\mathcal{S}^*(L))$.

Let $G \simeq \mathrm{G}(3,6)$ be a fiber of $\pi_{\mathscr{Y}_3}$. Noting $L_{\mathscr{Y}_3}$ and $\mathfrak{Q}$ are the pull-backs of locally free sheaves on $\mathscr{Y}_3$, we see that the restriction of $\mathcal{A}_3^* \otimes \mathcal{B}_3(-t \det \mathcal{Q} + tL_{\mathscr{Y}_3})$ to G is a direct sum of the following sheaves:

$$\begin{aligned}
&\mathcal{O}_G(-t)\\
&\mathcal{S}|_G(-t), \quad \mathcal{S}^*|_G(-t),\\
&\mathcal{Q}|_G(-t), \quad \mathcal{Q}^*|_G(-t),\\
&\mathcal{S}|_G \otimes \mathcal{Q}|_G(-t), \quad \mathcal{S}^*|_G \otimes \mathcal{Q}^*|_G(-t),\\
&\mathcal{S}^*|_G \otimes \mathcal{S}|_G(-t), \quad \mathcal{Q}^*|_G \otimes \mathcal{Q}|_G(-t)
\end{aligned} \tag{5.20}$$

By Theorem 2.1, all the cohomology groups of the sheaves in (5.20) vanish for $0 \le t \le 5$ except for $t = 0$ and $\mathcal{S}^*|_G$, $\mathcal{Q}|_G$, $\mathcal{S}^*|_G \otimes \mathcal{S}|_G$, or $\mathcal{Q}^*|_G \otimes \mathcal{Q}|_G$. Therefore we may show Theorem 5.1 by the Leray spectral sequence for $\pi_{\mathscr{Y}_3}$. $\square$

In the subsequent subsections, we will reduce the proof of Theorem in the remaining cases to the case where $1 \le t \le 4$.

5.5. **Case $n = 4$ and $6 \le t \le 9$.** In this case, we have only to show the following:

Proposition 5.8. *For $\mathcal{C} = \widetilde{\mathcal{A}}^* \otimes \widetilde{\mathcal{B}}$ as above, it holds*

$$H^{\bullet}(\widetilde{\mathscr{Y}}, \mathcal{C}(-t)) \simeq H^{13-\bullet}(\widetilde{\mathscr{Y}}, \mathcal{C}^*(t-10))$$

for any integer t.

Then the proof of Theorem 5.1 in the case where $6 \le t \le 9$ is reduced immediately to the case where $1 \le t \le 4$. For our proof of the above proposition, we note that each of the cohomology groups $H^{\bullet}(\widetilde{\mathscr{Y}}, \mathcal{C}(-t))$ is Serre dual to

$$H^{13-\bullet}(\widetilde{\mathscr{Y}}, \mathcal{C}^*((t-10)M_{\widetilde{\mathscr{Y}}} + 2F_{\widetilde{\mathscr{Y}}})).$$

Then, from the exact sequence

$$0 \to \mathcal{C}^*((t-10)M_{\widetilde{\mathscr{Y}}} + (i-1)F_{\widetilde{\mathscr{Y}}}) \to \mathcal{C}^*((t-10)M_{\widetilde{\mathscr{Y}}} + iF_{\widetilde{\mathscr{Y}}}) \to \mathcal{C}^*((t-10)M_{\widetilde{\mathscr{Y}}} + iF_{\widetilde{\mathscr{Y}}})|_{F_{\widetilde{\mathscr{Y}}}} \to 0,$$

we see that it suffices to show the following vanishings:

$$H^{13-\bullet}(F_{\widetilde{\mathscr{Y}}}, \mathcal{A}_i) = 0 \text{ for } i = 1, 2 \text{ and any } \bullet, \tag{5.21}$$

where we set

$$\mathcal{A}_i := \mathcal{C}^*((t-10)M_{\widetilde{\mathscr{Y}}} + iF_{\widetilde{\mathscr{Y}}})|_{F_{\widetilde{\mathscr{Y}}}}.$$

We evaluate the cohomologies (5.21) on the exceptional divisor $F_{\widetilde{\mathscr{Y}}}$ by using the flattening $F^{(3)} \to \widehat{G}'$ of the contraction $F_{\widetilde{\mathscr{Y}}} \to G_{\mathscr{Y}}$, which we have constructed in [14, Subsect. 5.5]. We will use the notation there freely. Note that, since the morphism $\widehat{F} \to F_{\widetilde{\mathscr{Y}}}$ is finite, and $\widehat{F}$ has only rational singularities by its construction, the desired vanishings follow from the vanishings of the cohomology groups of the pull-backs of $\mathcal{A}_i$ on $F^{(3)}$. Also, since the morphism $F^{(3)} \to \widehat{G}'$ is flat, we have only to show the vanishing along its fibers. Then, by the upper semi-continuity of cohomology groups on fibers, it suffices to prove the vanishing on the fibers $Fib^{(3)}(V_3, V_4, V_4) = A \cup B$ over the points $([V_3]; [V_4], [V_4]) \in \widehat{G}'$, where we refer [14, Prop. 5.11] for the notation. Note that the restriction of the pull-back of $M_{\widetilde{\mathscr{Y}}}$ to the fibers is trivial. Therefore, it suffices to show

$$H^{\bullet}(A \cup B, \mathcal{C}^*_{A \cup B}(iF_{A \cup B})) = 0 \, (i = 1, 2), \tag{5.22}$$

where $\mathcal{C}_{A\cup B}$ and $F_{A\cup B}$ are the pull-backs of $\mathcal{C}$ and $F_{\widetilde{\mathscr{Y}}}$ to $A\cup B$, respectively. We recall $A=\mathbb{P}(\mathcal{O}_{\mathrm{G}(2,V_4)}\oplus\mathcal{U}_{\mathrm{G}(2,V_4)}(1))|_{\mathrm{G}(2,V_3)}$ and a natural morphism $A\to\mathrm{G}(2,V_3)=\mathbb{P}(V_3^*)$. Also recall that $E_{AB}=A\cap B$ is a divisor on A.

In Lemma A.1 in Appendix A, we describe several pull-backs to A and B of locally free sheaves on $\widetilde{\mathscr{Y}}$. Using this we can complete our proof of Proposition 5.8 as follows:

Proof of Proposition 5.8**.** It suffices to show the vanishings of (5.22). Tensoring $\mathcal{C}^*_{A\cup B}(iF_{A\cup B})$ with the Mayor-Vietris sequence, we have

$$0\to\mathcal{C}^*_{A\cup B}(iF_{A\cup B})\to\mathcal{C}^*_A(iF_A)\oplus\mathcal{C}^*_B(iF_B)\to\mathcal{C}^*_{A\cap B}(iF_{A\cap B})\to 0, \tag{5.23}$$

where $\mathcal{C}_A$, $\mathcal{C}_B$, and $\mathcal{C}_{A\cap B}$ are the restrictions of $\mathcal{C}_{A\cup B}$ to A, B and $A\cap B$ respectively, and $F_{A\cap B}$ is the restriction of $F_{A\cup B}$ to $A\cap B$. By using Lemma A.1 (1), it is straightforward to verify the vanishings of $H^\bullet(A,\mathcal{C}^*_A(iF_A))$. Also, by Lemma A.1 (2), we see that the restriction maps $H^\bullet(B,\mathcal{C}^*_B(iF_B))\to H^\bullet(A\cap B,\mathcal{C}^*_{A\cap B}(iF_{A\cap B}))$ are isomorphisms. Then we have the desired vanishings of $H^\bullet(A\cup B,\mathcal{C}^*_{A\cup B}(iF_{A\cup B}))$. □

5.6. **Case** $n=3$ **and** $t=6,7$**.** For $n=3$, it remains to show the vanishings of $H^\bullet(\widetilde{\mathcal{B}}(-6))$ and $H^\bullet(\widetilde{\mathcal{B}}(-7))$ for $\widetilde{\mathcal{B}}=\mathcal{O}_{\widetilde{\mathscr{Y}}}$, $\widetilde{\mathfrak{Q}}$, $\widetilde{\mathcal{S}}^*_L$, or $\widetilde{\mathcal{Q}}$. For this, we have only to show the following:

Proposition 5.9. *It holds*

$$H^\bullet(\widetilde{\mathscr{Y}},\widetilde{\mathcal{B}}(-t))\simeq H^{9-\bullet}(\widetilde{\mathscr{Y}},\widetilde{\mathcal{B}}^*(t-8))$$

for any integer t*.*

Proof. We can show the assertion in the same way to the proof of Proposition 5.8 using Lemma A.1. □

5.7. **Calculating** $H^0(\widetilde{\mathscr{Y}},\widetilde{\mathcal{Q}}^*\otimes\widetilde{\mathcal{Q}}(M))$**.** In the last part of the proof of [15, Thm. 8.3.2], we use the following lemma:

Lemma 5.10. *Suppose* $n=3$*. There exists a unique* $\mathrm{SL}\,(V)$*-equivariant map* $\widetilde{\mathcal{Q}}^*\boxtimes\mathcal{O}_{\check{\mathscr{X}}}\to\widetilde{\mathcal{Q}}^*(M)\boxtimes\mathcal{O}_{\check{\mathscr{X}}}(H)$ *up to constant.*

Proof. We compute

$$H^0(\widetilde{\mathcal{Q}}^*\otimes\widetilde{\mathcal{Q}}(M)\boxtimes\mathcal{O}_{\check{\mathscr{X}}}(H))\simeq H^0(\widetilde{\mathscr{Y}},\widetilde{\mathcal{Q}}^*\otimes\widetilde{\mathcal{Q}}(M))\otimes H^0(\check{\mathscr{X}},\mathcal{O}_{\check{\mathscr{X}}}(H)).$$

We have $H^0(\check{\mathscr{X}},\mathcal{O}_{\check{\mathscr{X}}}(H))\simeq\mathsf{S}^2V^*$. To compute $H^0(\widetilde{\mathscr{Y}},\widetilde{\mathcal{Q}}^*\otimes\widetilde{\mathcal{Q}}(M))$, we tensor $\widetilde{\mathcal{Q}}^*\otimes\widetilde{\mathcal{Q}}$ to the exact sequence

$$0\to\mathcal{O}_{\widetilde{\mathscr{Y}}}(M)\to\det\widetilde{\mathcal{Q}}\otimes\wedge^4V^*\to\det\widetilde{\mathcal{Q}}|_{F_\rho}\otimes\wedge^4V^*\to 0$$

induced from Proposition 5.2. By Theorem 2.1 and the Littlewood-Richardson rule, we have

$$\begin{aligned}H^0(\widetilde{\mathscr{Y}},\widetilde{\mathcal{Q}}^*\otimes\widetilde{\mathcal{Q}}(\det\widetilde{\mathcal{Q}}))\otimes\wedge^4V^*\simeq H^0(\widetilde{\mathscr{Y}},\wedge^2\widetilde{\mathcal{Q}}\otimes\widetilde{\mathcal{Q}})\otimes\wedge^4V^*\simeq&\\ (H^0(\widetilde{\mathscr{Y}},\wedge^3\widetilde{\mathcal{Q}})\oplus H^0(\widetilde{\mathscr{Y}},\Sigma^{(2,1)}\widetilde{\mathcal{Q}}))\otimes\wedge^4V^*\simeq&\\ (\wedge^3(\wedge^2V)\oplus\Sigma^{(2,1,0,0,0,0)}\wedge^2V)\otimes\wedge^4V^*.&\end{aligned}$$

By the plethysm of the Schur functors

$$\wedge^3(\wedge^2V)\simeq\Sigma^{(3,1,1,1)}V\oplus\Sigma^{(2,2,2,0)}V,$$

$$\Sigma^{(2,1,0,0,0,0)} \wedge^2 V \simeq \Sigma^{(2,2,1,1)}V \oplus \Sigma^{(3,2,1,0)}V,$$

we obtain

$$\begin{aligned} &H^0(\widetilde{\mathscr{Y}}, \widetilde{\mathcal{Q}}^* \otimes \widetilde{\mathcal{Q}}(\det \widetilde{\mathcal{Q}})) \otimes \wedge^4 V^* \simeq \\ &\Sigma^{(2,0,0,0)}V \oplus \Sigma^{(1,1,1,-1)}V \oplus \Sigma^{(1,1,0,0)}V \oplus \Sigma^{(2,1,0,-1)}V. \end{aligned} \tag{5.24}$$

By Proposition 4.10, we have

$$\begin{aligned} &H^0(F_\rho, \widetilde{\mathcal{Q}}^* \otimes \widetilde{\mathcal{Q}}(\det \widetilde{\mathcal{Q}})|_{F_\rho}) \otimes \wedge^4 V^* \simeq \\ &H^0(\mathbb{P}(V), (\Omega^1_{\mathbb{P}(V)}(1))^* \otimes \Omega^1_{\mathbb{P}(V)}(1) \otimes \mathcal{O}_{\mathbb{P}(V)}(2)) \otimes \wedge^4 V. \end{aligned}$$

By Theorem 2.1 and the Littlewood-Richardson rule, we obtain

$$H^0(F_\rho, \widetilde{\mathcal{Q}}^* \otimes \widetilde{\mathcal{Q}}(\det \widetilde{\mathcal{Q}})|_{F_\rho}) \otimes \wedge^4 V^* \simeq \Sigma^{(1,1,1,-1)}V \oplus \Sigma^{(2,1,0,-1)}V. \tag{5.25}$$

Since the identity of $\mathrm{Hom}(\widetilde{\mathcal{Q}}, \widetilde{\mathcal{Q}})$ induces that of $\mathrm{Hom}(\Omega^1_{\mathbb{P}(V)}(2), \Omega^1_{\mathbb{P}(V)}(2))$, the component $\Sigma^{(1,1,1,-1)}V$ in (5.24) is mapped isomorphically in (5.25). Therefore, $H^0(\widetilde{\mathscr{Y}}, \widetilde{\mathcal{Q}}^* \otimes \widetilde{\mathcal{Q}}(M))$ consists of at most $\Sigma^{(2,0,0,0)}V \simeq \mathsf{S}^2V$, $\Sigma^{(1,1,0,0)}V$, and $\Sigma^{(2,1,0,-1)}V$ (it seems that $H^0(\widetilde{\mathscr{Y}}, \widetilde{\mathcal{Q}}^* \otimes \widetilde{\mathcal{Q}}(M)) \simeq \Sigma^{(2,0,0,0)}V \oplus \Sigma^{(1,1,0,0)}V$ but we do not need to prove this). Hence $\mathrm{SL}\,(V)$-invariant sections of $H^0(\widetilde{\mathscr{Y}}, \widetilde{\mathcal{Q}}^* \otimes \widetilde{\mathcal{Q}}(M)) \otimes H^0(\check{\mathscr{X}}, \mathcal{O}_{\check{\mathscr{X}}}(H))$ come from the identity element of $\mathsf{S}^2V \otimes \mathsf{S}^2V^*$ up to constant. □

5.8. **Lefschetz collection in $\mathcal{D}^b(\widetilde{\mathscr{Y}})$.** It is straightforward to obtain the following result from Theorem 5.1.

Corollary 5.11. *Suppose $n = 3$. Let $\Lambda := \{3, 2, 1_a, 1_b\}$ be an ordered set $(\Lambda, \prec)$. Define*

$$(\mathcal{E}_\alpha)_{\alpha \in \Lambda} := (\mathcal{E}_3, \mathcal{E}_2, \mathcal{E}_{1a}, \mathcal{E}_{1b}) = (\mathcal{O}_{\widetilde{\mathscr{Y}}}, \widetilde{\mathfrak{Q}}, \widetilde{\mathcal{S}}^*_L, \widetilde{\mathcal{Q}})$$

be an ordered collection of sheaves. Set

$$\mathcal{D}_{\mathscr{Y}} := \langle \mathcal{E}_3, \mathcal{E}_2, \mathcal{E}_{1a}, \mathcal{E}_{1b} \rangle \subset \mathcal{D}^b(\widetilde{\mathscr{Y}}).$$

Then

$$\mathcal{D}_{\mathscr{Y}}, \mathcal{D}_{\mathscr{Y}}(1), \ldots, \mathcal{D}_{\mathscr{Y}}(5), \mathcal{O}_{\widetilde{\mathscr{Y}}}(6), \mathcal{O}_{\widetilde{\mathscr{Y}}}(7)$$

is a Lefschetz collection, where (t) represents the twist by the sheaf $\mathcal{O}_{\widetilde{\mathscr{Y}}}(tM)$.

Remark 5.12. By similar calculations to show Theorem 5.1, we obtain the following:

(1) The ordered collection of sheaves $(\mathcal{E}_3, \mathcal{E}_2, \mathcal{E}_{1a}, \mathcal{E}_{1b})$ is a strongly exceptional collection in $\mathcal{D}^b(\widetilde{\mathscr{Y}})$.

(2) Hom's of the sheaves in the above collection are given by the following diagram:

$$\begin{tikzcd}
 & & \mathcal{E}_{1a} \\
\mathcal{E}_3 \arrow[rru, bend left, "\wedge^2 V"] \arrow[r, "V"] \arrow[rrd, bend right, "\wedge^2 V"'] & \mathcal{E}_2 \arrow[ru, "V"'] \arrow[rd, "V"] & \\
 & & \mathcal{E}_{1b}
\end{tikzcd}$$

In case $n = 4$, the following Lefschetz collection is suitable for our purpose (see [12]).

Corollary 5.13. *Suppose $n = 4$. Let $\Lambda := \{3, 2, 1_a, 1_b\}$ be an ordered set $(\Lambda, \prec)$. Define*

$$(\mathcal{E}_\alpha)_{\alpha\in\Lambda} := (\mathcal{E}_3, \mathcal{E}_2, \mathcal{E}_{1_a}, \mathcal{E}_{1_b}) = (\widetilde{\mathcal{S}}_L,\ \widetilde{\mathfrak{Q}}^*,\ \mathcal{O}_{\widetilde{\mathscr{Y}}},\ \widetilde{\mathcal{Q}}^*(M))$$

be an ordered collection of sheaves on $\widetilde{\mathscr{Y}}$. Set

$$\mathcal{D}_{\widetilde{\mathscr{Y}}} := \langle \mathcal{E}_3, \mathcal{E}_2, \mathcal{E}_{1_a}, \mathcal{E}_{1_b}\rangle \subset \mathcal{D}^b(\widetilde{\mathscr{Y}}).$$

Then

$$\mathcal{D}_{\widetilde{\mathscr{Y}}}, \mathcal{D}_{\widetilde{\mathscr{Y}}}(1), \ldots, \mathcal{D}_{\widetilde{\mathscr{Y}}}(9)$$

is a Lefschetz collection, where (t) represents the twist by the sheaf $\mathcal{O}_{\widetilde{\mathscr{Y}}}(tM)$.

Proof. Writing $\mathcal{D}_{\widetilde{\mathscr{Y}}}, \mathcal{D}_{\widetilde{\mathscr{Y}}}(1), \ldots, \mathcal{D}_{\widetilde{\mathscr{Y}}}(9)$ explicitly, we obtain

$$\begin{array}{r}
\widetilde{\mathcal{S}}_L,\ \widetilde{\mathfrak{Q}}^*,\ \mathcal{O}_{\widetilde{\mathscr{Y}}},\\
\widetilde{\mathcal{Q}}^*(M),\ \widetilde{\mathcal{S}}_L(M),\ \widetilde{\mathfrak{Q}}^*(M),\ \mathcal{O}_{\widetilde{\mathscr{Y}}}(M),\\
\cdots,\\
\widetilde{\mathcal{Q}}^*(9M),\ \widetilde{\mathcal{S}}_L(9M),\ \widetilde{\mathfrak{Q}}^*(9M),\ \mathcal{O}_{\widetilde{\mathscr{Y}}}(9M),\\
\widetilde{\mathcal{Q}}^*(10M).
\end{array}$$

Let $\mathcal{C}$ be any sheaf in this sequence except $\widetilde{\mathcal{Q}}^*(10M)$. Then, by Proposition 5.8, we have $\mathrm{Hom}^\bullet(\widetilde{\mathcal{Q}}^*(10M), \mathcal{C}) \simeq \mathrm{Hom}^\bullet(\mathcal{C}, \widetilde{\mathcal{Q}}^*)$. Hence we may replace the sequence by $\mathcal{D}', \mathcal{D}'(1), \ldots, \mathcal{D}'(9)$ with $\mathcal{D}' = \langle \widetilde{\mathcal{Q}}^*,\ \widetilde{\mathcal{S}}_L,\ \widetilde{\mathfrak{Q}}^*,\ \mathcal{O}_{\widetilde{\mathscr{Y}}}\rangle$. Now the assertion follows immediately from Theorem 5.1. □

Remark 5.14. By similar calculations to show Theorem 5.1, we obtain the following (see [13]):

(1) $(\mathcal{E}_\alpha)_{\alpha\in\Lambda}$ is a strongly exceptional collection.

(2) Hom's of the sheaves in the above collection are given by the following diagram:

$$\begin{tikzcd}
 & & \mathcal{E}_{1_a} \\
\mathcal{E}_3 \arrow[r, "V"] \arrow[rru, bend left, "\wedge^2 V"] \arrow[rrd, bend right, "\mathsf{S}^2 V"'] & \mathcal{E}_2 \arrow[ru, "V"'] \arrow[rd, "V"] & \\
 & & \mathcal{E}_{1_b}
\end{tikzcd} \tag{5.26}$$

Remark 5.15. Since the singularity of the double symmetroid $\mathscr{Y}$ is complicated, [19, Theorem 1] seems to be difficult to apply for the resolution $\widetilde{\mathscr{Y}} \to \mathscr{Y}$ to obtain a categorical resolution of $D^b(\mathscr{Y})$. However, we expect that the Lefschetz collection $\mathcal{D}_{\widetilde{\mathscr{Y}}}, \mathcal{D}_{\widetilde{\mathscr{Y}}}(1), \ldots, \mathcal{D}_{\widetilde{\mathscr{Y}}}(9)$ gives a Lefschetz decomposition of a strongly crepant categorical resolution, if exists, of $\mathcal{D}^b(\mathscr{Y})$.

Appendix A. Pull-backs of sheaves to the flattening of $F_{\widetilde{\mathscr{Y}}} \to G_{\mathscr{Y}}$

In this section, we consider the situation as in [14, Subsect. 5.5] and use the notation there freely.

Here we fix V_{n-1} and V_n, and consider sheaves on the fiber $Fib^{(3)}(V_{n-1}, V_n, V_n) = A \cup B$ of $F^{(3)} \to \hat{G}'$.

Lemma A.1. *Denote by H_A the pull-back on A of $\mathcal{O}_{\mathbb{P}(V^*_{n-1})}(1)$. We denote by $\mathcal{E}_A$ and $\mathcal{E}_B$ the pull-backs of a locally free sheaf $\mathcal{E}$ on $\widetilde{\mathscr{Y}}$ to A and B, respectively. In particular, F_A and F_B stand for the pull-backs of $F_{\widetilde{\mathscr{Y}}}$ to A and B. Then we have the following isomorphisms:*

(1) $F_A \sim -(E_{AB}+2H_A)$, $(\widetilde{\mathcal{S}}^*_L)_A \simeq \widetilde{\mathcal{Q}}_A \simeq \mathcal{O}_A \oplus \mathcal{V}$, *and* $\widetilde{\mathfrak{Q}}_A \simeq \mathcal{O}_A^{\oplus 2} \oplus \mathcal{V}$ *with a locally free sheaf* $\mathcal{V}$ *given by a unique non-split extension*

$$0 \to \mathcal{O}_A(H_A + E_{AB}) \to \mathcal{V} \to \mathcal{O}_A(H_A) \to 0.$$

(2) $F_B \simeq p_B^*\mathcal{O}_{\mathrm{G}(n-3,V_{n-1})}(-1)$, $(\widetilde{\mathcal{S}}^*_L)_B \simeq \widetilde{\mathcal{Q}}_B \simeq \mathcal{O}_B \oplus p_B^*\mathfrak{Q}_{V_{n-1}}$, *and* $\widetilde{\mathfrak{Q}}_B \simeq \mathcal{O}_B^{\oplus 2} \oplus p_B^*\mathfrak{Q}_{V_{n-1}}$, *where* $\mathfrak{Q}_{V_{n-1}}$ *is the universal quotient bundle on* $\mathrm{G}(n-3, V_{n-1})$, *and* $p_B \colon B \to \mathrm{G}(n-3, V_{n-1})$ *is given in* [14, Prop. 5.10 and 5.11].

Proof. Let G be the exceptional divisor for $\widehat{A} \to A$ and $L_{\widehat{A}}$, $H_{\widehat{A}}$, and $\widehat{E}_{AB}$ the pull-backs on $\widehat{A}$ of $\mathcal{O}_{\mathrm{G}(n-3,V_{n-1})}(1)$, H_A and E_{AB}, respectively.

Step 1. $\widehat{E}_{AB} + 2H_{\widehat{A}} - G = L_{\widehat{A}}$.

As in [14, Prop. 5.13], we denote by $s_A \subset A$ the locus of ρ-conics, which is a section associated to an injection to an injection $\mathcal{O}_{\mathbb{P}(V^*_{n-1})} \to \mathcal{O}_{\mathbb{P}(V^*_{n-1})} \oplus T_{\mathbb{P}(V^*_{n-1})}$. Let $\mathcal{I}$ be the ideal sheaf of s_A in A, and consider the exact sequence

$$0 \to \mathcal{O}_A(E_{AB} + 2H_A) \otimes \mathcal{I} \to \mathcal{O}_A(E_{AB} + 2H_A) \to \mathcal{O}_{s_A}(2H_A) \to 0,$$

where the last term is obtained since $s_A \cap E_{AB} = \emptyset$. Let $\pi_A \colon A \to \mathbb{P}(V^*_{n-1})$ be the natural morphism. Then $\pi_{A*}(\mathcal{O}_A(E_{AB}+2H_A)\otimes\mathcal{I}) \simeq \Omega^1_{\mathbb{P}(V^*_{n-1})}(2) \simeq \wedge^{n-3}T_{\mathbb{P}(V^*_{n-1})}$. From this, we see that the natural map

$$H^0(\mathcal{O}_A(E_{AB} + 2H_A) \otimes \mathcal{I}) \otimes \mathcal{O}_A \to \mathcal{O}_A(E_{AB} + 2H_A) \otimes \mathcal{I}$$

is surjective and $H^0(\mathcal{O}_A(E_{AB} + 2H_A) \otimes \mathcal{I}) \simeq H^0(\wedge^{n-3}T_{\mathbb{P}(V^*_{n-1})}) \simeq \wedge^{n-3}V^*_{n-1}$. This is equivalent to that $|\widehat{E}_{AB} + 2H_{\widehat{A}} - G|$ is base point free and it defines a morphism $\Phi \colon \widehat{A} \to \mathbb{P}(\wedge^{n-3}V_{n-1})$. Φ factors through $A_{\mathscr{Y}_2}$ since it contracts E_{AB}. Let $\Phi' \colon A_{\mathscr{Y}_2} \to \mathbb{P}(\wedge^{n-3}V_{n-1})$ be the induced morphism. Φ' does not coincide with $A_{\mathscr{Y}_2} \to A_{\widetilde{\mathscr{Y}}}$ since the latter contracts the image of G. Therefore Φ' induces the quadric fibration $A_{\mathscr{Y}_2} \to \mathrm{G}(n-3, V_{n-1})$. In particular, we have $\widehat{E}_{AB} + 2H_{\widehat{A}} - G = L_{\widehat{A}}$ as desired.

Step 2. $\det(\widetilde{\mathcal{S}}^*_L)_A = \det \widetilde{\mathcal{Q}}_A = E_{AB} + 2H_A$.

By (5.2), we have only to determine $\det \widetilde{\mathcal{Q}}_A$. Note that G coincides with the pull-back of $F_\rho|_{\mathscr{Y}_2}$, where F_ρ is the exceptional divisor of $\mathscr{Y}_2 \to \widetilde{\mathscr{Y}}$. Therefore, by Proposition 5.2, we have $\det \widetilde{\mathcal{Q}}_A = G + L_{\widehat{A}}$ since $M_{\widetilde{\mathscr{Y}}}$ is trivial on a fiber of $F_{\widetilde{\mathscr{Y}}} \to G_{\mathscr{Y}}$. Now the assertion follows from Step 1.

Step 3. $F_A = -(E_{AB} + 2H_A)$.

By Proposition 5.4, we have $F'_{\widetilde{\mathscr{Y}}} = 2M_{\mathscr{Y}_2} - L_{\mathscr{Y}_2} - F_\rho$. Since G coincides with the pull-back of $F_\rho|_{\mathscr{Y}_2}$ and $M_{\widetilde{\mathscr{Y}}}$ is trivial on a fiber of $F_{\widetilde{\mathscr{Y}}} \to G_{\mathscr{Y}}$, it holds that $F_{\widehat{A}} = -(L_{\widehat{A}} + G)$. Therefore the assertion follows from Step 1.

Step 4. $(\widetilde{\mathcal{S}}^*_L)_A \simeq \widetilde{\mathcal{Q}}_A \simeq \mathcal{O}_A \oplus \mathcal{V}$.

We investigate the restriction of the universal exact sequence (4.1) on $A_{\mathscr{Y}_3}$. Let $\mathcal{S}_{A_{\mathscr{Y}_3}}$ and $\mathcal{Q}_{A_{\mathscr{Y}_3}}$ be the restrictions of $\mathcal{S}$ and $\mathcal{Q}$, respectively. Then we obtain

$$0 \to \mathcal{S}_{A_{\mathscr{Y}_3}} \to \pi^*_{A_{\mathscr{Y}_3}}(\wedge^2\mathfrak{Q}|_{\mathrm{G}(n-3,V_{n-1})}) \to \mathcal{Q}_{A_{\mathscr{Y}_3}} \to 0. \tag{A.1}$$

$\mathfrak{Q}|_{\mathrm{G}(n-3,V_{n-1})}$ splits as

$$\mathfrak{Q}|_{\mathrm{G}(n-3,V_{n-1})} \simeq \mathfrak{Q}_{V_{n-1}} \oplus V/V_{n-1} \otimes \mathcal{O}_{\mathrm{G}(n-3,V_{n-1})}.$$

Therefore we have the following isomorphisms:

$$\text{(A.2)} \quad \wedge^2 \left(\mathfrak{Q}|_{\mathrm{G}(n-3,V_{n-1})}\right) \simeq$$
$$\mathcal{O}_{\mathrm{G}(n-3,V_{n-1})}(1) \oplus \Big(\mathfrak{Q}_{V_{n-1}} \otimes (V/V_{n-1})\Big) \oplus \wedge^2(V/V_{n-1}) \otimes \mathcal{O}_{\mathrm{G}(n-3,V_{n-1})}.$$

Let $[V_{n-3}]$ be a point of $\mathrm{G}(n-3, V_{n-1})$. (A.2) means fiberwise

$$\text{(A.3)} \quad \wedge^2 (V/V_{n-3}) \simeq \wedge^2(V_{n-1}/V_{n-3}) \oplus (V_{n-1}/V_{n-3}) \otimes (V/V_{n-1}) \oplus \wedge^2(V/V_{n-1}).$$

Now we recall [14, Rem. 5.14]. Let Γ be the fiber of $A_{\mathscr{Y}_3} \to \mathrm{G}(n-3, V_{n-1})$ over $[V_{n-3}]$. The vertex of the quadric cone Γ corresponds to the σ-plane $\mathrm{P}_{V_n/V_{n-3}} = \{\mathbb{C}^2 \subset V_n/V_{n-3}\}$. Points $[\mathrm{P}_{V_{n-2}/V_{n-3}}]$ which correspond to ρ-planes and are contained in Γ satisfy $V_{n-3} \subset V_{n-2}$. Since Γ is the cone over the Veronese curve $v_2(\mathbb{P}(V_{n-1}/V_{n-3}))$, it is swept out by lines joining $[\mathrm{P}_{V_n/V_{n-3}}]$ and $[\mathrm{P}_{V_{n-2}/V_{n-3}}]$ such that $V_{n-3} \subset V_{n-2} \subset V_{n-1}$. A line in $\mathrm{G}(3, \wedge^2(V/V_{n-3}))$ is of the form $\{W_2 \subset \mathbb{C}^3 \subset W_4\}$ with some $W_i \simeq \mathbb{C}^i$ $(i = 2, 4)$. We take a basis $\boldsymbol{e}_1, \dots, \boldsymbol{e}_4$ of V/V_{n-3} such that $V_{n-2}/V_{n-3} = \langle \boldsymbol{e}_1 \rangle$, $V_{n-1}/V_{n-3} = \langle \boldsymbol{e}_1, \boldsymbol{e}_2 \rangle$, and $V_n/V_{n-3} = \langle \boldsymbol{e}_1, \boldsymbol{e}_2, \boldsymbol{e}_3 \rangle$. For the line joining $[\mathrm{P}_{V_n/V_{n-3}}]$ and $[\mathrm{P}_{V_{n-2}/V_{n-3}}]$, it is easy to see that

$$W_2 = \langle \boldsymbol{e}_1 \wedge \boldsymbol{e}_2, \boldsymbol{e}_1 \wedge \boldsymbol{e}_3 \rangle \simeq \wedge^2(V_{n-1}/V_{n-3}) \oplus (V_{n-2}/V_{n-3}) \otimes (V_n/V_{n-1}),$$

$$W_4 = \langle \boldsymbol{e}_1 \wedge \boldsymbol{e}_2, \boldsymbol{e}_1 \wedge \boldsymbol{e}_3, \boldsymbol{e}_1 \wedge \boldsymbol{e}_4, \boldsymbol{e}_2 \wedge \boldsymbol{e}_3 \rangle \subset \wedge^2(V_{n-1}/V_{n-3}) \oplus (V_{n-1}/V_{n-3}) \otimes (V/V_{n-1}),$$

and

$$(\wedge^2(V_{n-1}/V_{n-3}) \oplus (V_{n-1}/V_{n-3}) \otimes (V/V_{n-1}))/W_4 \simeq \langle \boldsymbol{e}_2 \wedge \boldsymbol{e}_4 \rangle \simeq V_{n-1}/V_{n-2} \otimes V/V_n.$$

As for $\mathcal{S}_{\widehat{A}}$, these imply the following:

- We can see that $\mathcal{S}_{\widehat{A}}$ contains the line bundle $L_{\widehat{A}}$ with fiber $\wedge^2(V_{n-1}/V_{n-3})$ as a direct summand. Hence, let us write $\mathcal{S}_{\widehat{A}} = \mathcal{S}'_{\widehat{A}} \oplus L_{\widehat{A}}$ with a locally free sheaf $\mathcal{S}'_{\widehat{A}}$ of rank two on $\widehat{A}$.
- $\mathcal{S}'_{\widehat{A}}$ contains a sub line bundle with fiber $(V_{n-2}/V_{n-3}) \otimes (V_n/V_{n-1})$, which is isomorphic to $-H_{\widehat{A}} + L_{\widehat{A}}$.

Therefore, by Step 2, we obtain

$$0 \to \mathcal{O}_{\widehat{A}}(-H_{\widehat{A}}) \to \mathcal{S}'_{\widehat{A}}(-L_{\widehat{A}}) \to \mathcal{O}_{\widehat{A}}(-H_{\widehat{A}} - \widehat{E}_{AB}) \to 0.$$

Since all the terms of the exact sequence are the pull-backs of locally free sheaves on A, the dual of this exact sequence descends to

$$0 \to \mathcal{O}_A(H_A + E_{AB}) \to (\mathcal{S}'_L)^*_A \to \mathcal{O}_A(H_A) \to 0,$$

where $(\mathcal{S}'_L)^*_A$ is the locally free sheaf on A such that its bull-back on $\widehat{A}$ is equal to $(\mathcal{S}'_{\widehat{A}})^*(L_{\widehat{A}})$. This sequence does not split since $(\mathcal{S}'_L)^*_A$ comes from a locally free sheaf on $A_{\widetilde{\mathscr{Y}}}$ while H_A does not. From

$$\mathrm{Ext}^1(\mathcal{O}_A(H_A), \mathcal{O}_A(H_A + E_{AB})) \simeq$$
$$H^1(A, \mathcal{O}_A(E_{AB})) \simeq H^1(\mathbb{P}(V^*_{n-1}), \mathcal{O}_{\mathbb{P}(V^*_{n-1})} \oplus \Omega^1_{\mathbb{P}(V^*_{n-1})}) \simeq \mathbb{C},$$

such a nonsplit extension is unique, which we denote by $\mathcal{V}$. Thus we obtain $(\widetilde{\mathcal{S}}^*_L)_A \simeq \mathcal{V} \oplus \mathcal{O}_A$, with a locally free sheaf $\mathcal{V}$ as described in (1).

Similarly, as for $\mathcal{Q}_{\widehat{A}}$, the above facts imply the following:

- We can see that $\mathcal{Q}_{\widehat{A}}$ contains the line bundle $\mathcal{O}_{\widehat{A}}$ with fiber $\wedge^2(V/V_{n-1})$ as a direct summand. Hence, let us write $\mathcal{Q}_{\widehat{A}} = \mathcal{Q}'_{\widehat{A}} \oplus \mathcal{O}_{\widehat{A}}$ with a locally free sheaf $\mathcal{Q}'_{\widehat{A}}$ of rank two on $\widehat{A}$.
- $\mathcal{Q}'_{\widehat{A}}$ have a quotient line bundle with fiber $V_{n-1}/V_{n-2} \otimes V/V_n$, which is isomorphic to $H_{\widehat{A}}$.

Therefore, by Step 2, we obtain

$$0 \to \mathcal{O}(H_{\widehat{A}} + \widehat{E}_{AB}) \to \mathcal{Q}'_{\widehat{A}} \to \mathcal{O}(H_{\widehat{A}}) \to 0.$$

In a similar way to determine $(\widetilde{\mathcal{S}}^*_L)_A$, we may obtain $\mathcal{Q}_A \simeq \mathcal{V} \oplus \mathcal{O}_A$ as desired.

Step 5. $\widetilde{\mathfrak{Q}}_A \simeq \mathcal{O}_A^{\oplus 2} \oplus \mathcal{V}$**.**

By [14, Rem. 5.14], $\mathscr{P}_\rho \cap A_{\mathscr{Y}_3} \simeq \mathbb{P}(\mathfrak{Q}_{V_{n-1}}) \simeq \mathrm{F}(n-3, n-2, V_{n-1})$. Restricting (4.3) to $A_{\mathscr{Y}_2}$, we obtain

$$0 \to \mathfrak{R}_{A_{\mathscr{Y}_2}} \to \pi^*_{A_{\mathscr{Y}_2}} \mathfrak{Q}^*_{V_{n-1}} \oplus \mathcal{O}^{\oplus 2}_{A_{\mathscr{Y}_2}} \to \iota_* \mathcal{O}_{\mathbb{P}(\mathfrak{Q}\ _{V_{n-1}})}(1) \to 0, \tag{A.4}$$

where we set $\mathfrak{R}_{A_{\mathscr{Y}_2}} = \mathfrak{R}_2|_{A_{\mathscr{Y}_2}}, \pi_{A_{\mathscr{Y}_2}} = \pi_{\mathscr{Y}_2}|_{A_{\mathscr{Y}_2}}$, $\iota : \mathbb{P}(\mathfrak{Q}_{V_{n-1}}) \hookrightarrow A_{\mathscr{Y}_2}$ and use $\mathcal{R}_2/\mathcal{R}_1 \simeq \mathcal{O}_{\mathbb{P}(\mathfrak{Q}\ )}(-1)$. Since $\mathrm{Hom}(\mathcal{O}_{A_{\mathscr{Y}_2}}, \mathcal{O}_{\mathbb{P}(\mathfrak{Q}\ _{V_{n-1}})}(1)) = H^0(\mathfrak{Q}^*_{V_{n-1}}) = 0$, we have the decomposition $\mathfrak{R}_{A_{\mathscr{Y}_2}} \simeq \mathcal{O}^{\oplus 2}_{A_{\mathscr{Y}_2}} \oplus \mathcal{V}'$ and also

$$0 \to \mathcal{V}' \to \pi^*_{A_{\mathscr{Y}_2}} \mathfrak{Q}^*_{V_{n-1}} \to \iota_* \mathcal{O}_{\mathbb{P}(\mathfrak{Q}\ _{V_{n-1}})}(1) \to 0. \tag{A.5}$$

Note that $\pi_{\widehat{A}}$ is a $\mathbb{F}_2$-fibration and it decomposes as $\widehat{A} \to \mathbb{P}(\mathfrak{Q}_{V_{n-1}}) \to \mathrm{G}(n-3, V_{n-1})$. On $\mathbb{P}(\mathfrak{Q}_{V_{n-1}}) \simeq \mathrm{F}(n-3, n-2, V_{n-1})$, we have a natural exact sequence

$$0 \to \mathcal{O}_{\mathbb{P}(\mathfrak{Q}\ _{V_{n-1}})}(-H_{\widehat{A}}) \to \pi^* \mathfrak{Q}^*_{V_{n-1}} \to \mathcal{O}_{\mathbb{P}(\mathfrak{Q}\ _{V_{n-1}})}(1) \to 0.$$

Pulling back on $\widehat{A}$, we obtain $0 \to \mathcal{O}_{\widehat{A}}(-H_{\widehat{A}}) \to \pi^*_{\widehat{A}} \mathfrak{Q}^*_{V_{n-1}} \to \mathcal{O}_{\widehat{A}}(H_{\widehat{A}} - L_{\widehat{A}}) \to 0$ such that the composite of $\mathcal{O}_{\widehat{A}}(-H_{\widehat{A}}) \to \pi^*_{\widehat{A}} \mathfrak{Q}^*_{V_{n-1}}$ with $\pi^*_{A_{\mathscr{Y}_2}} \mathfrak{Q}^*_{V_{n-1}} \to \iota_* \mathcal{O}_{\mathbb{P}(\mathfrak{Q}\ _{V_{n-1}})}(1)$ is a 0-map. Therefore it induces an injection $\mathcal{O}_{\widehat{A}}(-H_{\widehat{A}}) \to \mathcal{V}'$ with a locally free cokernel. Computing the determinants, we obtain

$$0 \to \mathcal{O}_{\widehat{A}}(-H_{\widehat{A}}) \to \mathcal{V}' \to \mathcal{O}_{\widehat{A}}(H_{\widehat{A}} - L_{\widehat{A}} - G) \to 0.$$

Since $H_{\widehat{A}} - L_{\widehat{A}} - G = -H_{\widehat{A}} - \widehat{E}_{AB}$ by Step 1, we obtain $\widetilde{\mathfrak{Q}}_A \simeq \mathcal{O}_A^{\oplus 2} \oplus \mathcal{V}$ in a similar way to determine $(\widetilde{\mathcal{S}}^*_L)_A$.

Step 6. F_B**,** $(\widetilde{\mathcal{S}}^*_L)_B$**,** $\widetilde{\mathcal{Q}}_B$ **and** $\widetilde{\mathfrak{Q}}_B$**.**

By [14, Prop. 5.10 and 5.11], the image of B on $F_{\widetilde{\mathscr{Y}}}$ is the $\mathrm{G}(n-3, V_{n-1})$ in $A_{\widetilde{\mathscr{Y}}}$. Therefore, F_B, $(\widetilde{\mathcal{S}}^*_L)_B$, $\widetilde{\mathcal{Q}}_B$ and $\widetilde{\mathfrak{Q}}_B$, respectively, are the pull-backs of the restrictions of $F_{\widetilde{\mathscr{Y}}}$, $\widetilde{\mathcal{S}}^*_L$ $\widetilde{\mathcal{Q}}$, and $\widetilde{\mathfrak{Q}}$ to $\mathrm{G}(n-3, V_{n-1})$. Since $F_A|_{E_{AB}} \simeq -(E_{AB} + 2H_A)|_{E_{AB}}$ by Step 3, and this is the pull-back of $\mathcal{O}_{\mathrm{G}(n-3,V_{n-1})}(-1)$, we have $F_B = p_B^* \mathcal{O}_{\mathrm{G}(n-3,V_{n-1})}(-1)$. Also, since $\widetilde{\mathfrak{Q}}_A \simeq \mathcal{O}_A \oplus (\widetilde{\mathcal{S}}^*_L)_A \simeq \mathcal{O}_A \oplus \widetilde{\mathcal{Q}}_A$ as above, we have $\widetilde{\mathfrak{Q}}_B \simeq \mathcal{O}_B \oplus (\widetilde{\mathcal{S}}^*_L)_B \simeq \mathcal{O}_B \oplus \widetilde{\mathcal{Q}}_B$. Thus we have only to determine $\widetilde{\mathfrak{Q}}_B$. Since $\mathrm{G}(n-3, V_{n-1})$ is contained in the locus of σ-plane, it is disjoint from the locus G_ρ of ρ-conics. Therefore, by (4.4), we have $\widetilde{\mathfrak{Q}}_B \simeq p_B^*(\mathfrak{Q}|_{\mathrm{G}(n-3,V_{n-1})}) \simeq \mathcal{O}_B^{\oplus 2} \oplus p_B^*(\mathfrak{Q}_{V_{n-1}})$. □
